

## Connection by means of a proxy behind Firewall using a web server with java-rmi.cgi script in the server

Connection to the server using the HTTP protocol by means of a Proxy that allows us to establish a connection with the web server that houses the script cgi. The client must be placed behind a Firewall. The Firewall will not allow a direct connection with the rmi server. The server itself will have to execute a webserver and a firewall that only permits input connections to port 80.

For this setting, the following test cases are presented:

- Three computers with Linux as their operating system, one of them executing the server + registry (application RemoteCalculatorServer), a web server listening on port 80 and a firewall that only permits input connections to port 80. Other machine executing the client (RemotecalculatorClient) and other acting as firewall and proxy. A test will be performed with the server being on and it should work without any problems.
- On the other hand, we will try to make a connection with the server, being this off. In this case, the client must fail.
- Finally, we will test if the inoperability with the package provided by SUN does not work.

### Execution Case 1

#### Requirements

Three computers that have Linux as their operating system  
JDK 1.5.0 of SUN

Computer N° 1 must execute RemoteCalculatorServer, a firewall (it will only permit connections to port 80) and a web Server with a cgi script provided by the jdk of Sun.

Computer N° 2 must execute RemoteCalculatorClient

Computer N° 3 must execute a proxy and a firewall

#### *Output computer N° 1 (RemoteCalculatorServer)*

```
