Bash scripts for use at client, firewall and server

All of this scripts require sudo (configured properly, otherwise it will ask for root password), Squid, Apache and Shorewall. Also it is necessary to set the full path to the java binary in JAVABIN, and the full path to the eclipse workspace in WORKSPACE. Optionally you can set the default server and proxy.

menuclient

It makes possible to run RemoteCalculatorClient, RemoteCalculatorClientBI and RemoteHashClient using the Sun or ITC RMI package, and modes (direct connection, http, cgi)

menuserver

It displays a menu with the possible Servers: RemoteCalculatorServer, RemoteCalculatorServerBI and RemoteHashServer using Sun or ITC RMI package. Also it allows to enable/disable the webserver and the firewall.

menufirewall

Presents options to enable/disable firewall and blocking port 1099 (rmiregistry). Also allows to enable/disable squid proxy server.
