```

<?xml version="1.0"?> <!-- =====
Pipelines defining all Source XML types Forrest can handle. Converts from arbitrary formats
to standard Forrest doc-v12 XML. First, determines if a simple format file exists. Candidates
are: .html .ihtml .txt .sxw .jspwiki Otherwise, the default *.xml handling is used. The XML's
DTD type is discovered using the SourceTypeAction, and an appropriate transformation applied.
Thus to add new XML types, just define a new <sourcetype> and an appropriate <map:when>
handler. Generates : Source XML, Body HTML for *.ehtml Example URL: http://localhost:8888/
index.xml Used by : *.html and *.pdf pipelines in sitemap.xmap Uses : content/xdocs/**/*.xml
