

# Executing WSRP Components

1. Start Tomcat.
2. Run the TCPMonitor program by executing the tunnel script in the tools directory. You may need to edit the tunnel script file to change the port mapping. By default, the SwingConsumer attempts to contact the Producer on port 8081. Tomcat is customarily configured to listen to port 8080. The tunnel script listens on port 8081 and writes to 8080 by default. If Tomcat is listening on a port other than 8080, you will have to edit the tunnel.bat file. Note that you can also alter the relevant ports once the TCPMonitor is started.
3. Run the SwingConsumer by executing the run script in the driver/SwingConsumer directory.
