

Apache Pulsar and its enterprise use cases

Yahoo Japan Corporation
Nozomi Kurihara

Sep., 27th, 2018

Who am I?

Nozomi Kurihara

- Software engineer at Yahoo! JAPAN (April 2012 ~)
- Working on internal messaging platform using Apache Pulsar
- Committer of Apache Pulsar

Agenda

- 1. What is Apache Pulsar?**
- 2. Why is Apache Pulsar useful?**
- 3. How does Yahoo! JAPAN uses Apache Pulsar?**

What is Apache Pulsar?

Agenda

1. What is Apache Pulsar?

- › History & Users
- › Pub-Sub messaging
- › Architecture
- › Client libraries
- › Topic
- › Subscription
- › Sample codes

2. Why is Apache Pulsar useful?

3. How does Yahoo! JAPAN uses Apache Pulsar?

Apache Pulsar

Flexible pub-sub system backed by durable log storage

History:

- › 2014 Development started at Yahoo! Inc.
- › 2015 Available in production in Yahoo! Inc.
- › Sep. 2016 Open-sourced (Apache License 2.0)
- › June 2017 Moved to Apache Incubator Project

Competitors:

- › Apache Kafka
- › RabbitMQ
- › Apache ActiveMQ
- › Apache RocketMQ
- etc.

Users:

- › Oath Inc. (Yahoo! Inc.)
- › Comcast
- › The Weather Channel
- › Mercado Libre
- › Streamlio
- › Yahoo! JAPAN

etc.

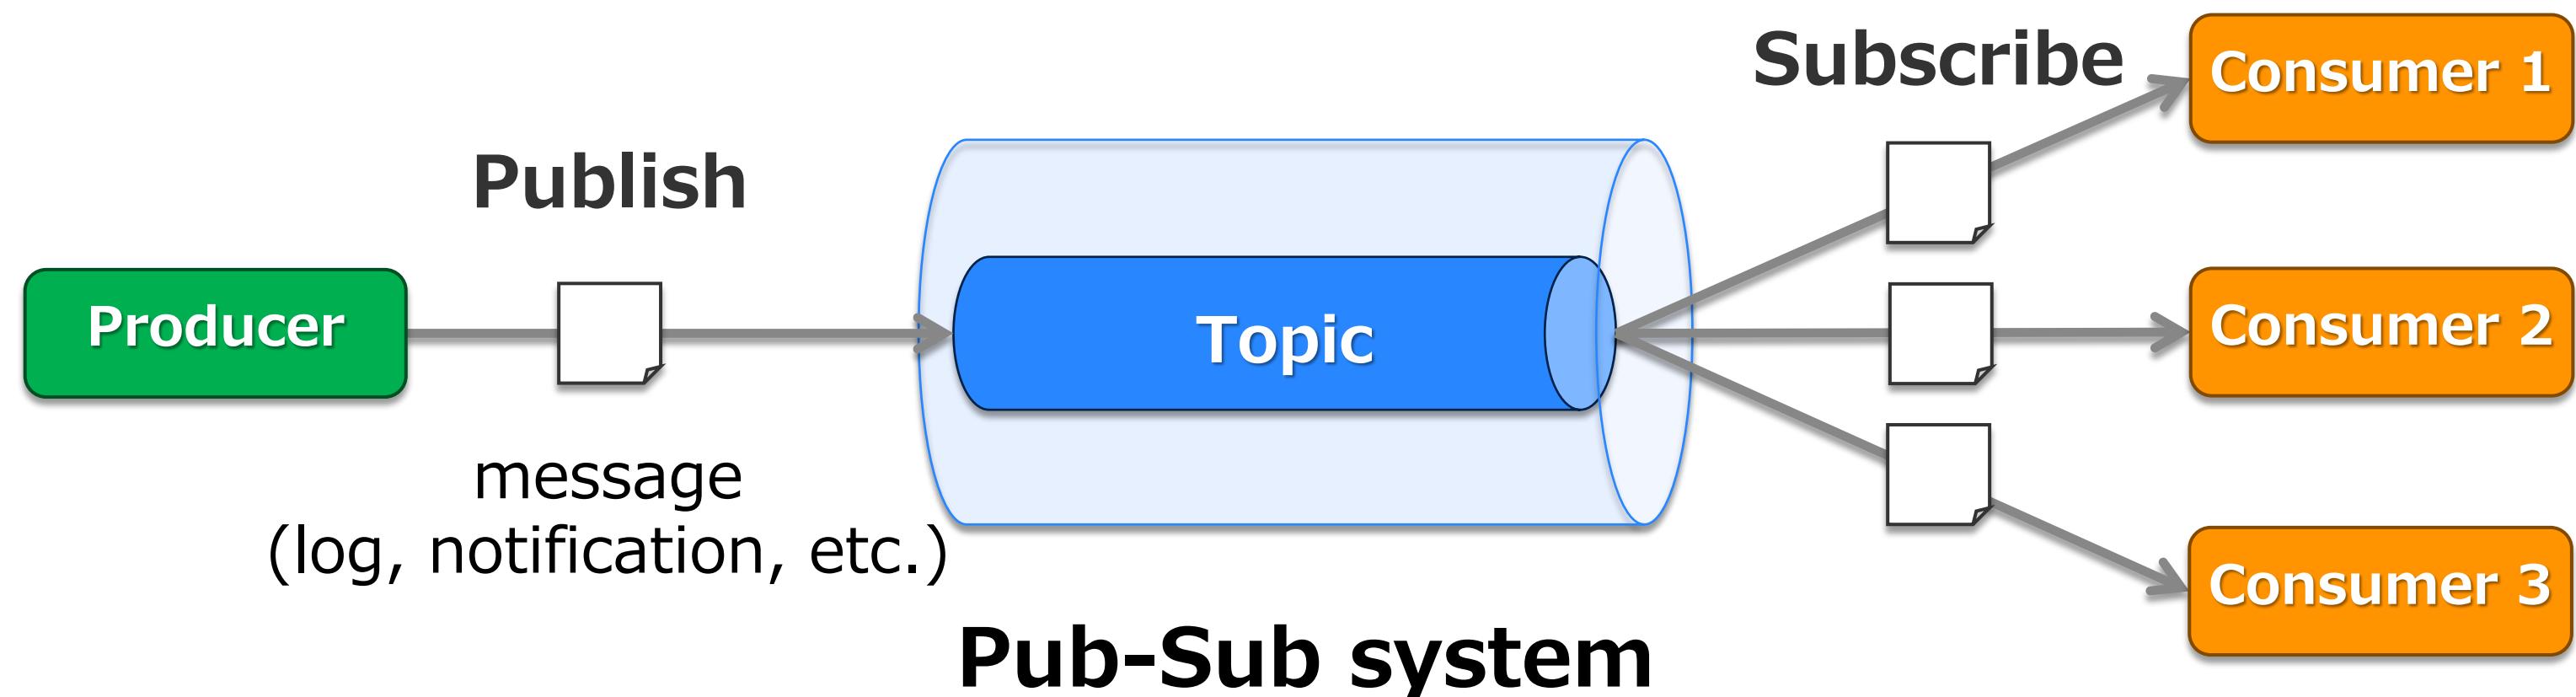

Pub-Sub messaging

*Message transmission from one system to another via **Topic***

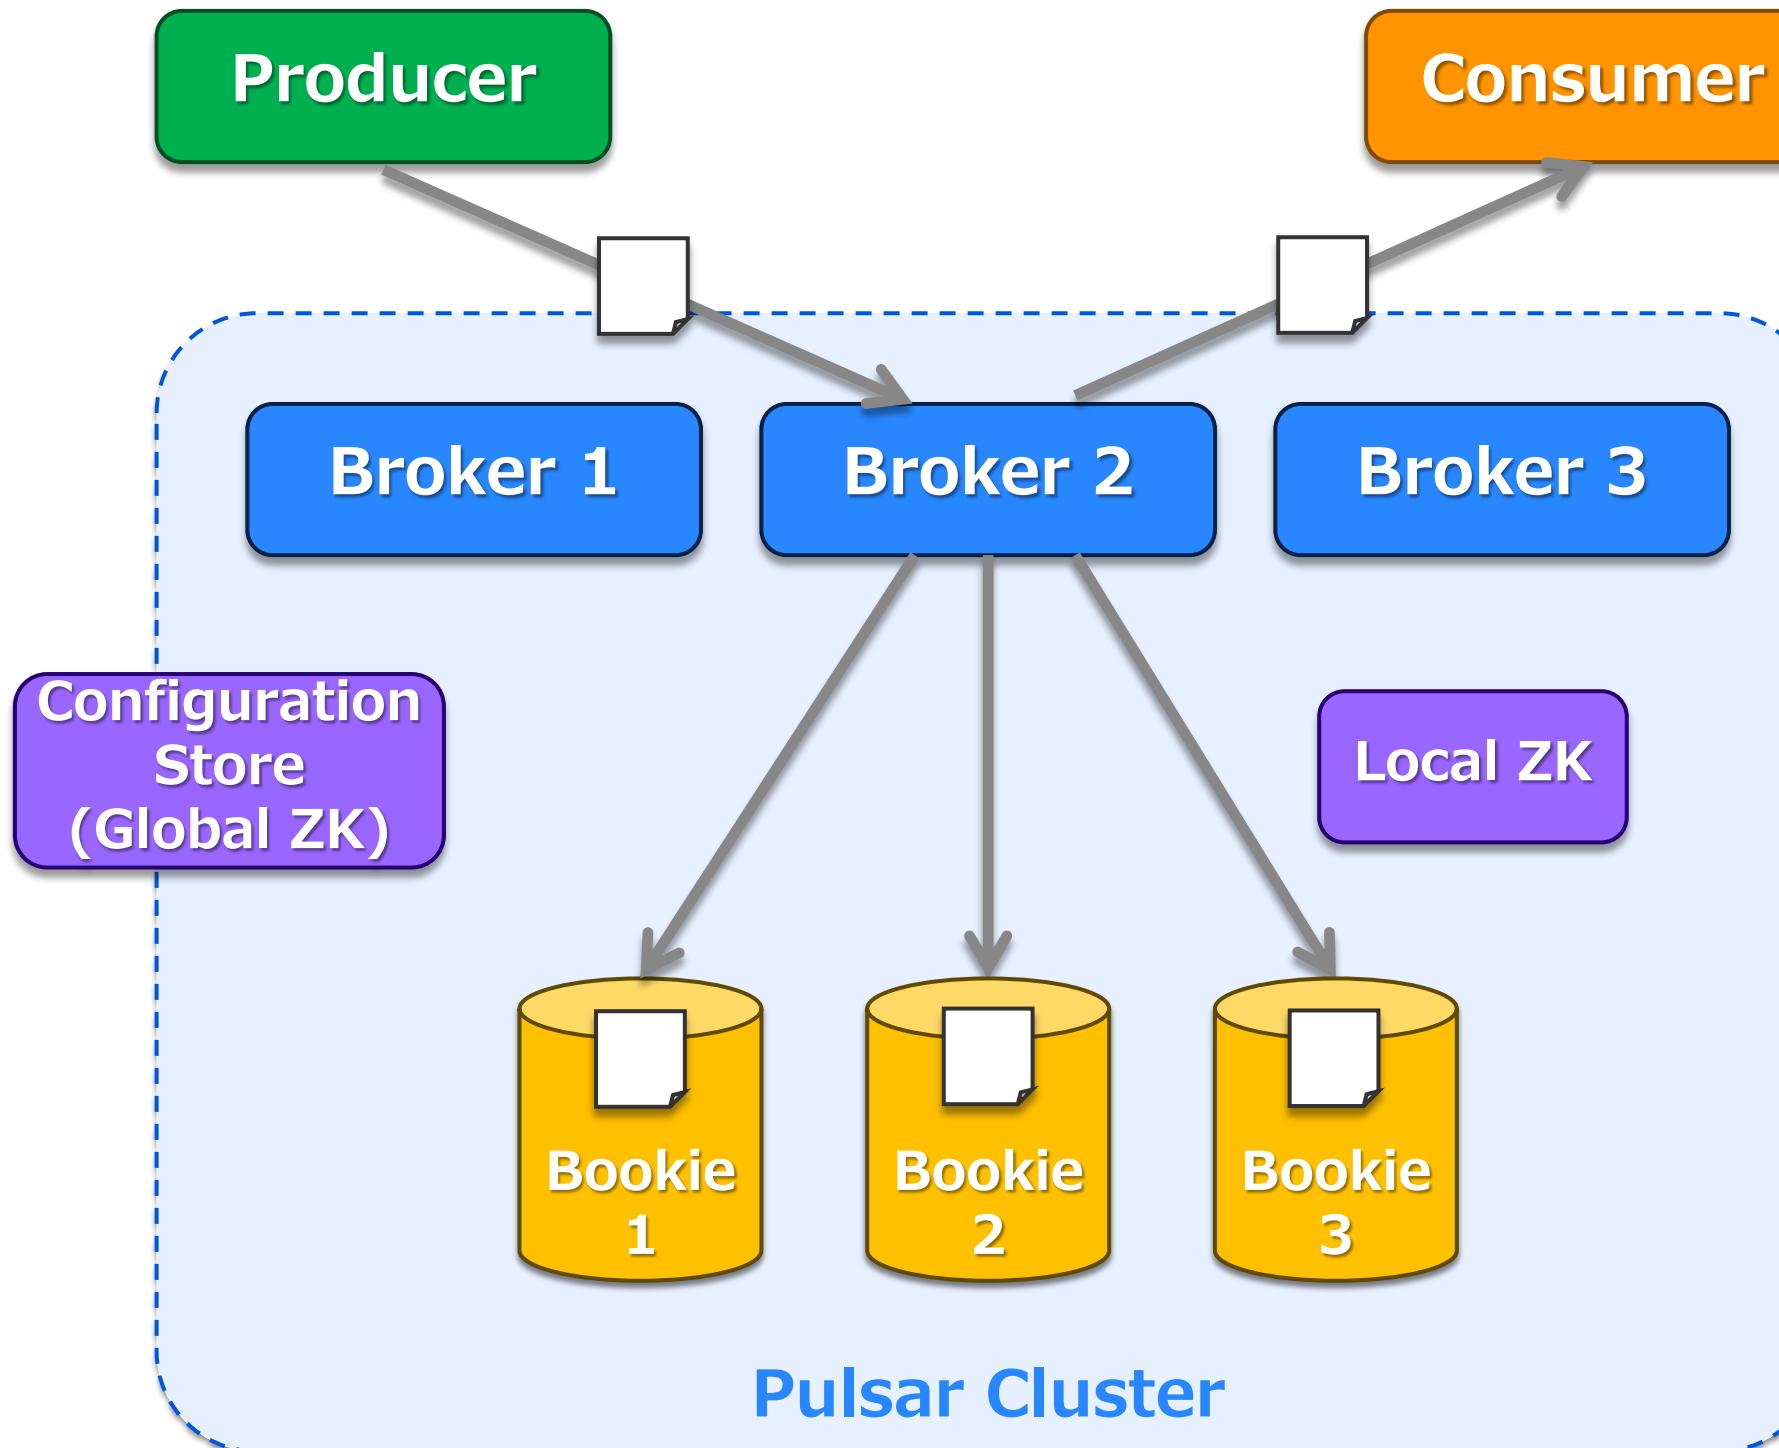

Producers publish messages to Topics

Consumers receive only messages from Topics to which they subscribe

Decoupled (no need to know each other) → asynchronous, scalable, resilient

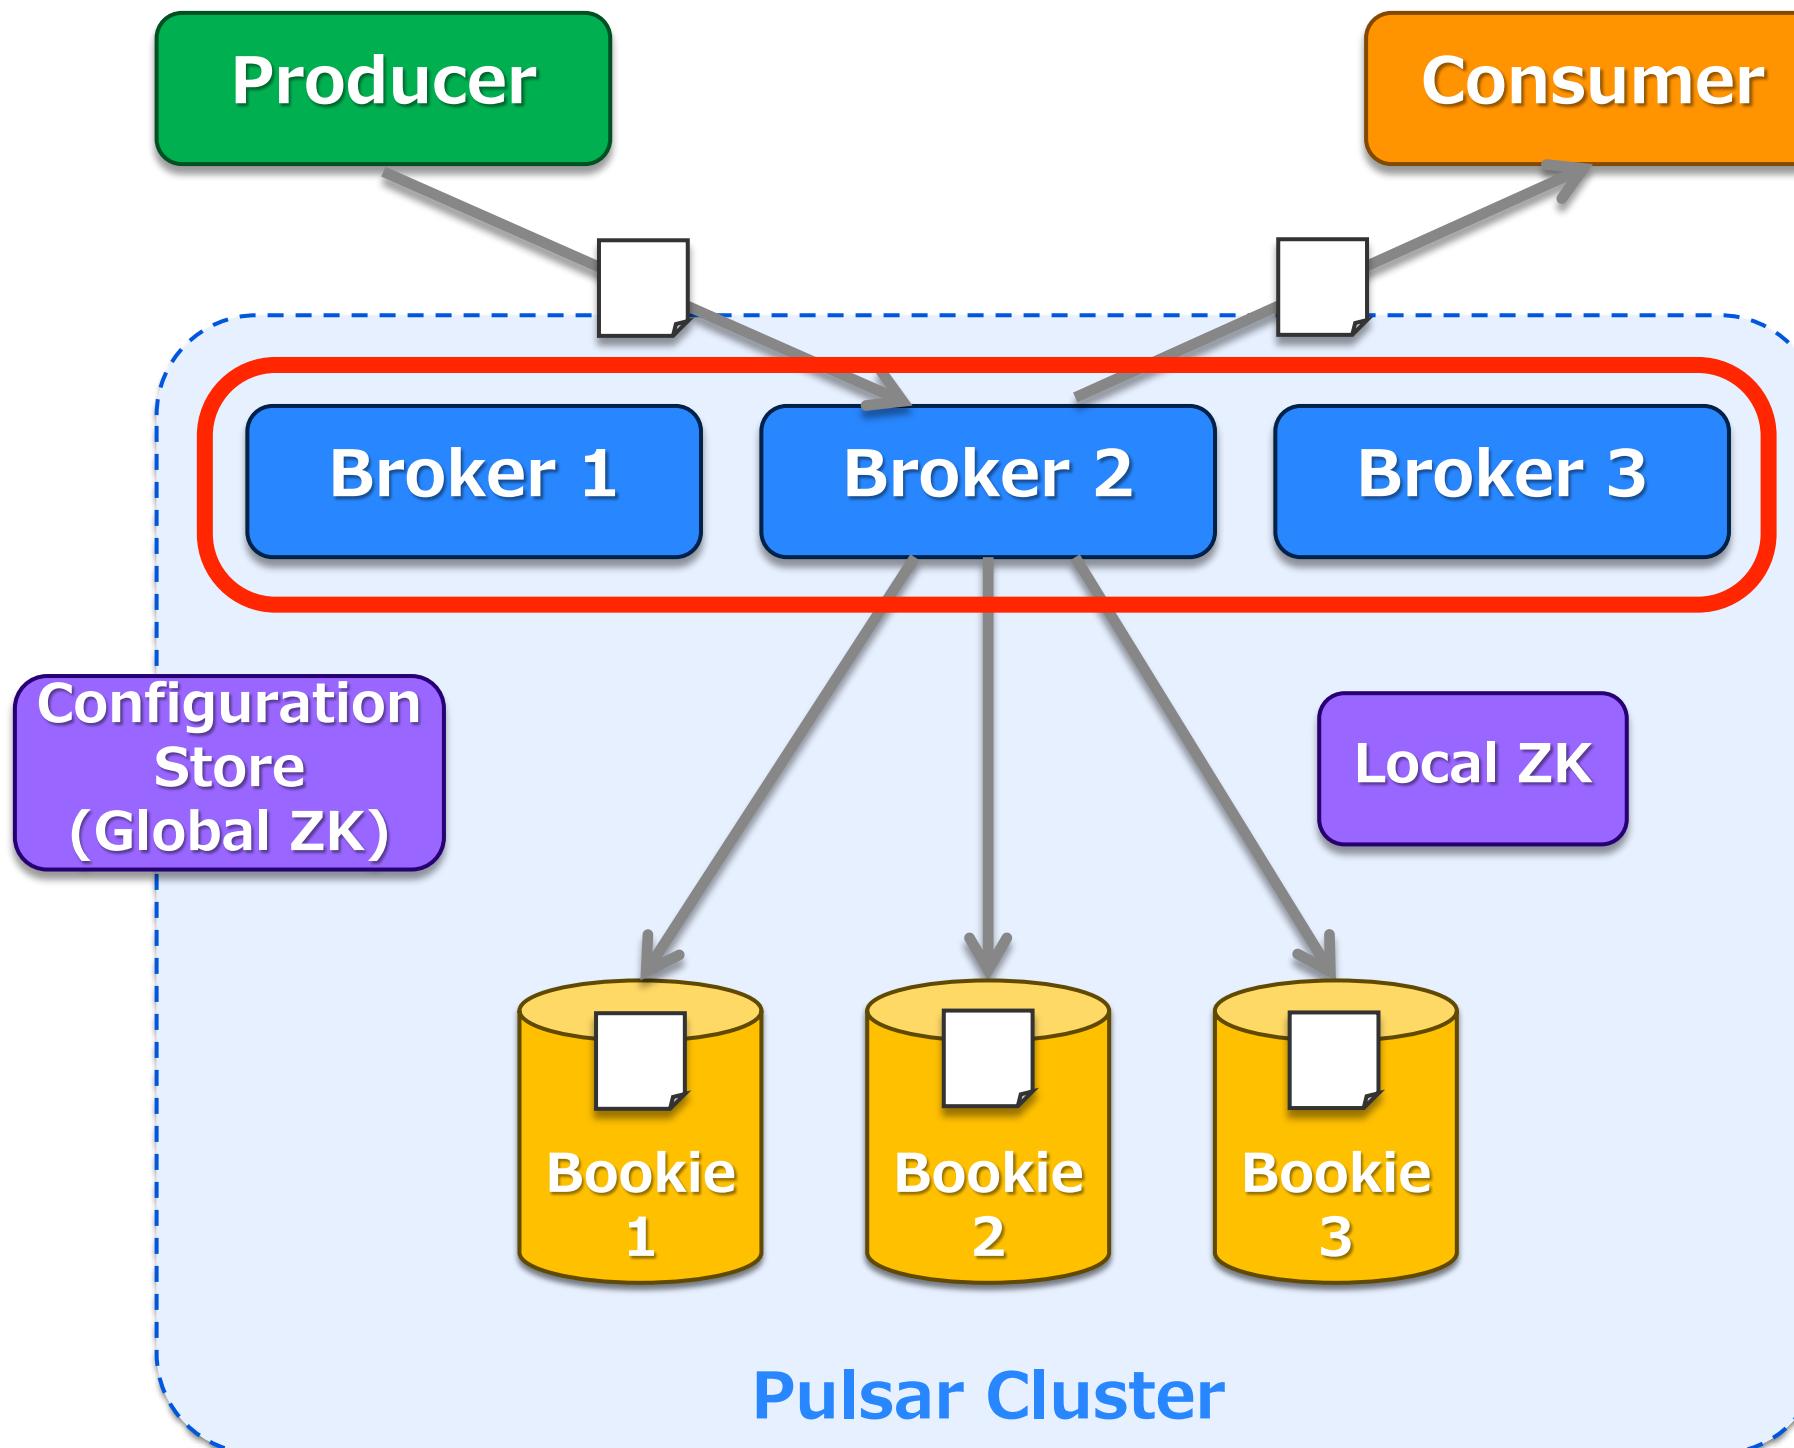

Architecture

■ 3 components:

- ▶ Broker
- ▶ Bookie
- ▶ ZooKeeper

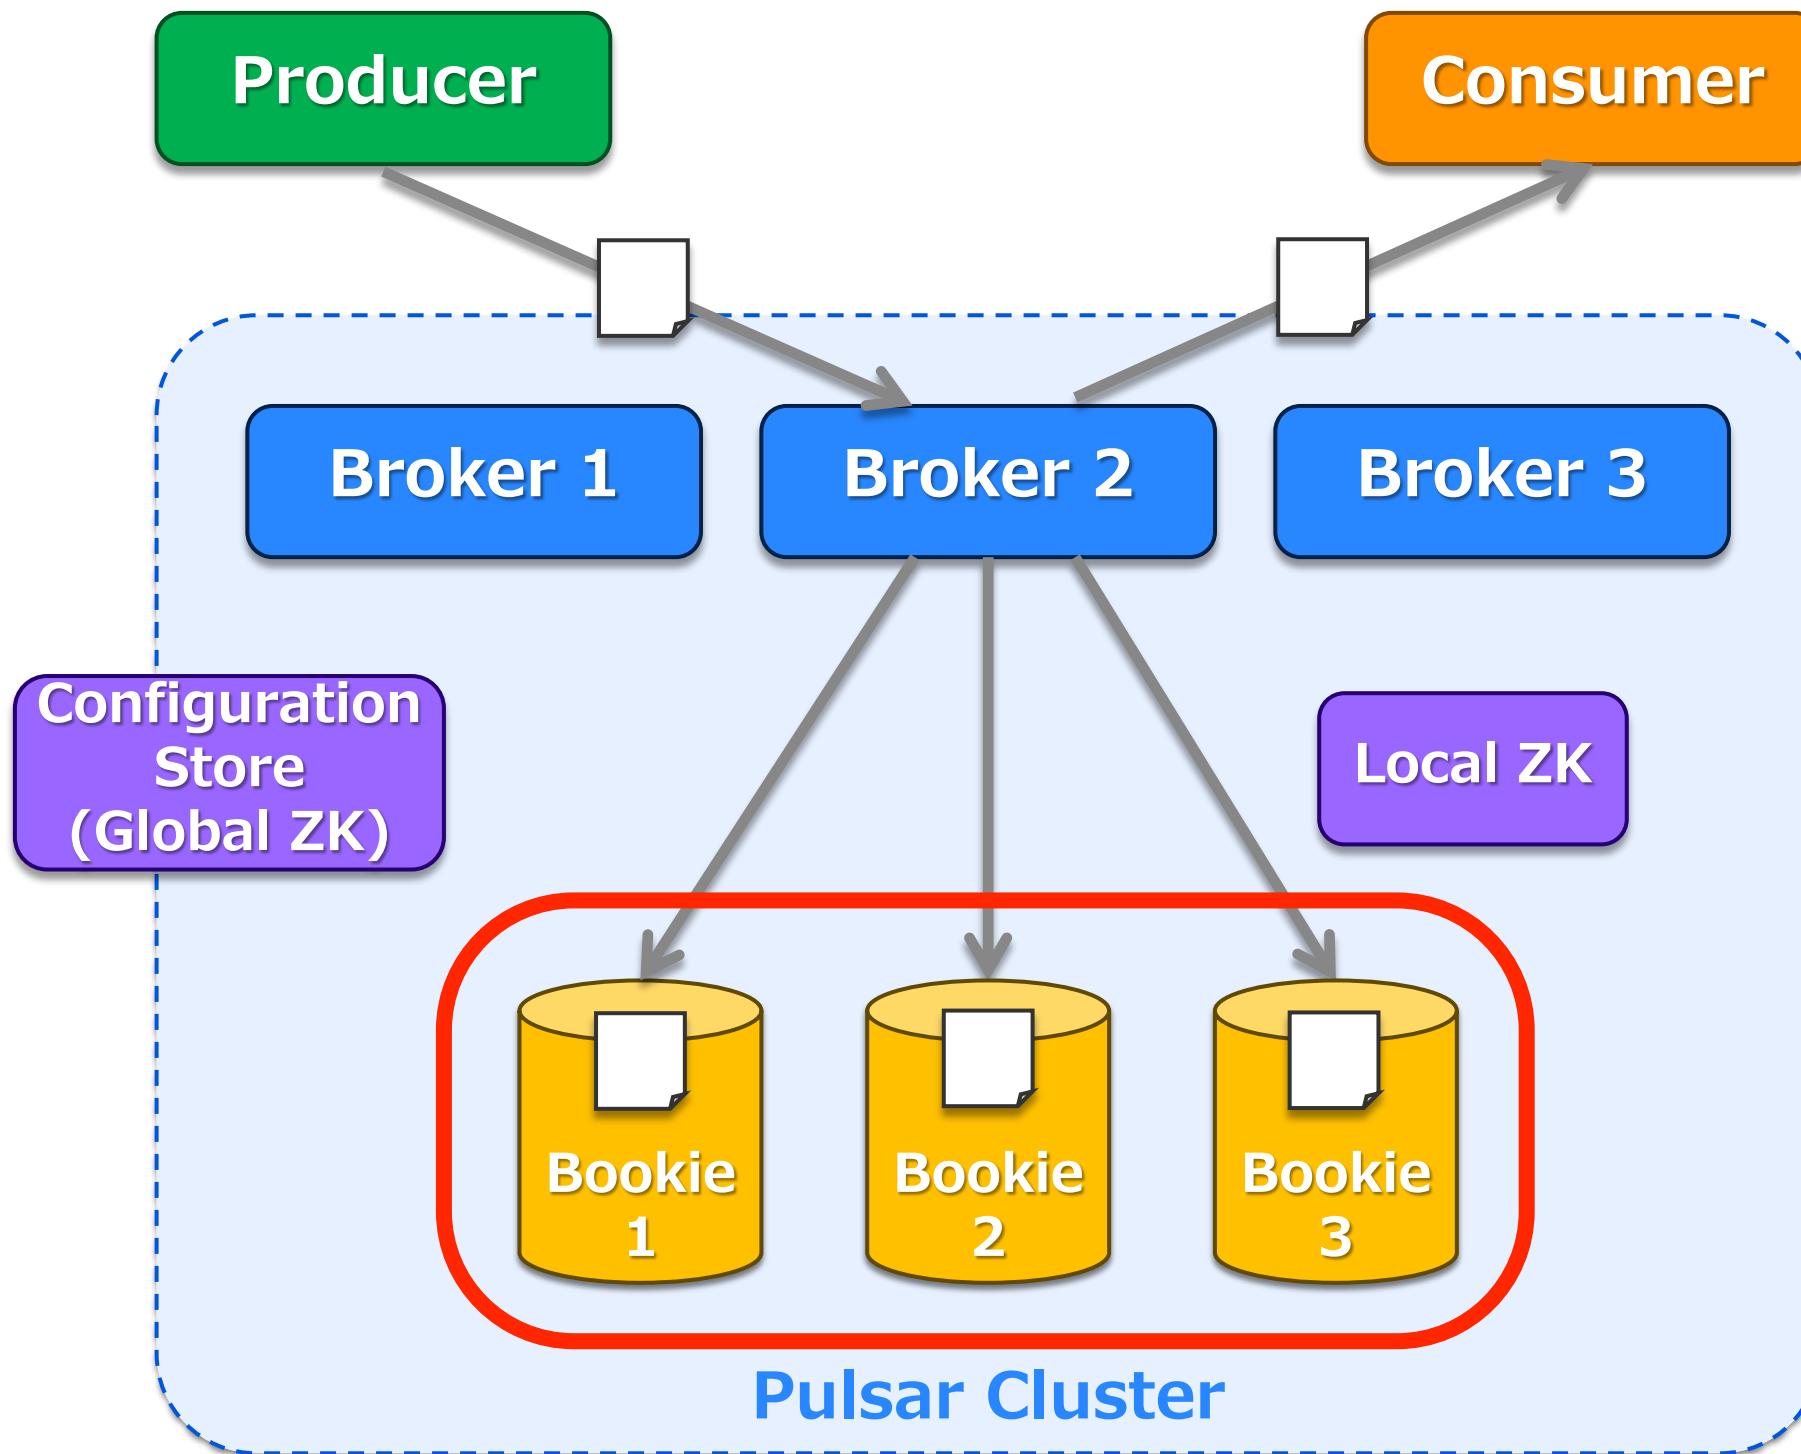

Architecture - Broker

■ Broker

- ▶ Serving node for clients' requests
- ▶ No data locality (**stateless**)

Architecture - Bookie

■ Bookie (Apache BookKeeper)

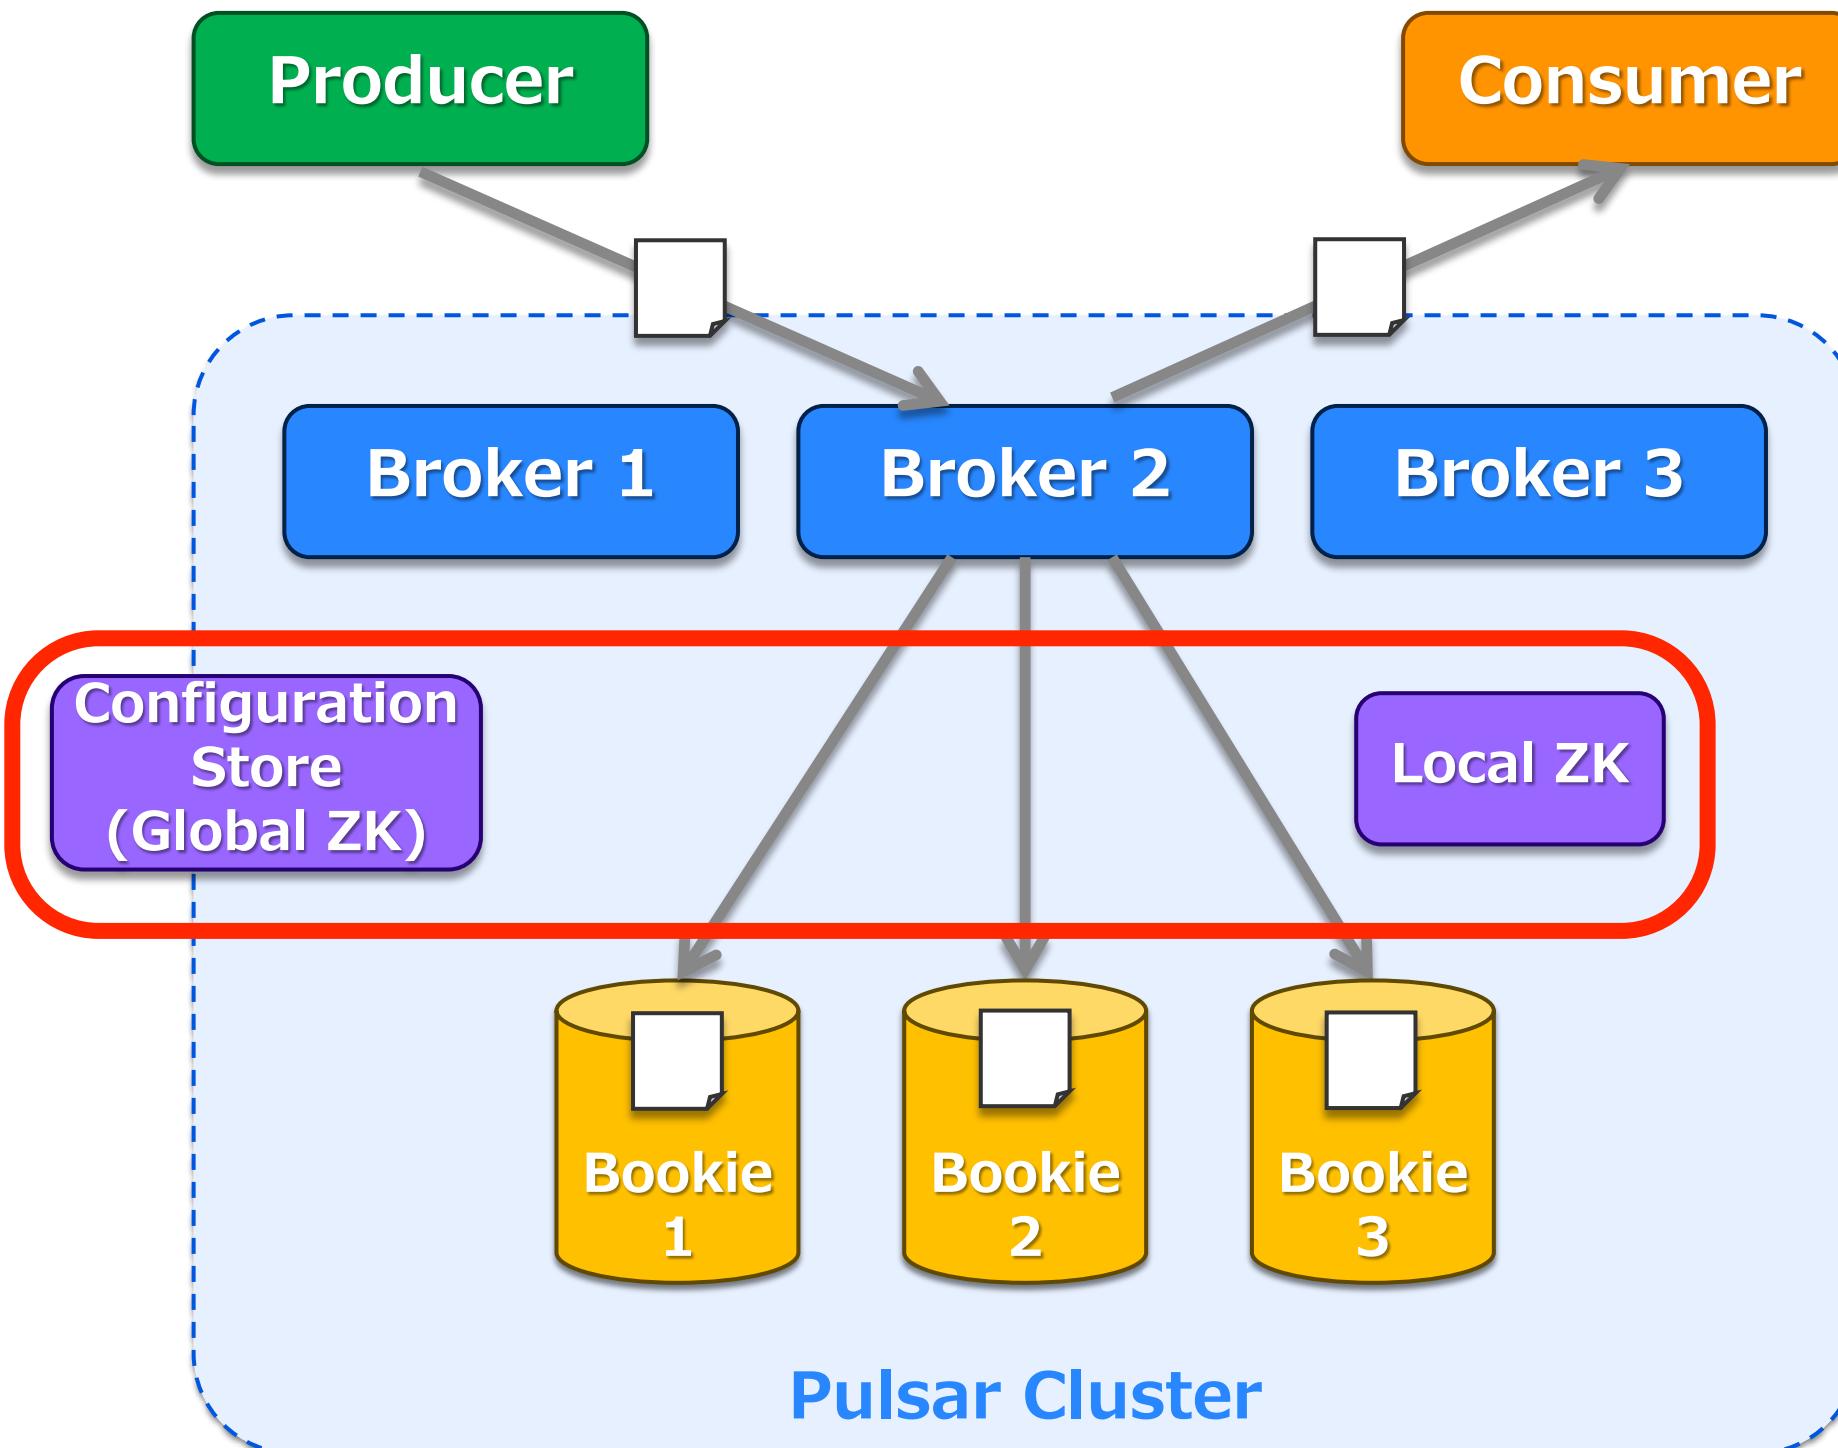

- Storage node for messages
- Durable, Scalable, Consistent, Fault-tolerant, Low-latency

Apache BookKeeper:
distributed write-ahead log system

Copyright © 2016 - 2018 The Apache Software Foundation,
licensed under the [Apache License, version 2.0](#).

Architecture - ZooKeeper

■ Apache ZooKeeper

- Store metadata and configuration
- **Local ZK**: within local cluster
- **Configuration Store**: across all clusters

Copyright © 2016 - 2018 [The Apache Software Foundation](#),
licensed under the [Apache License, version 2.0](#).

Client libraries

Supported client libraries:

Java

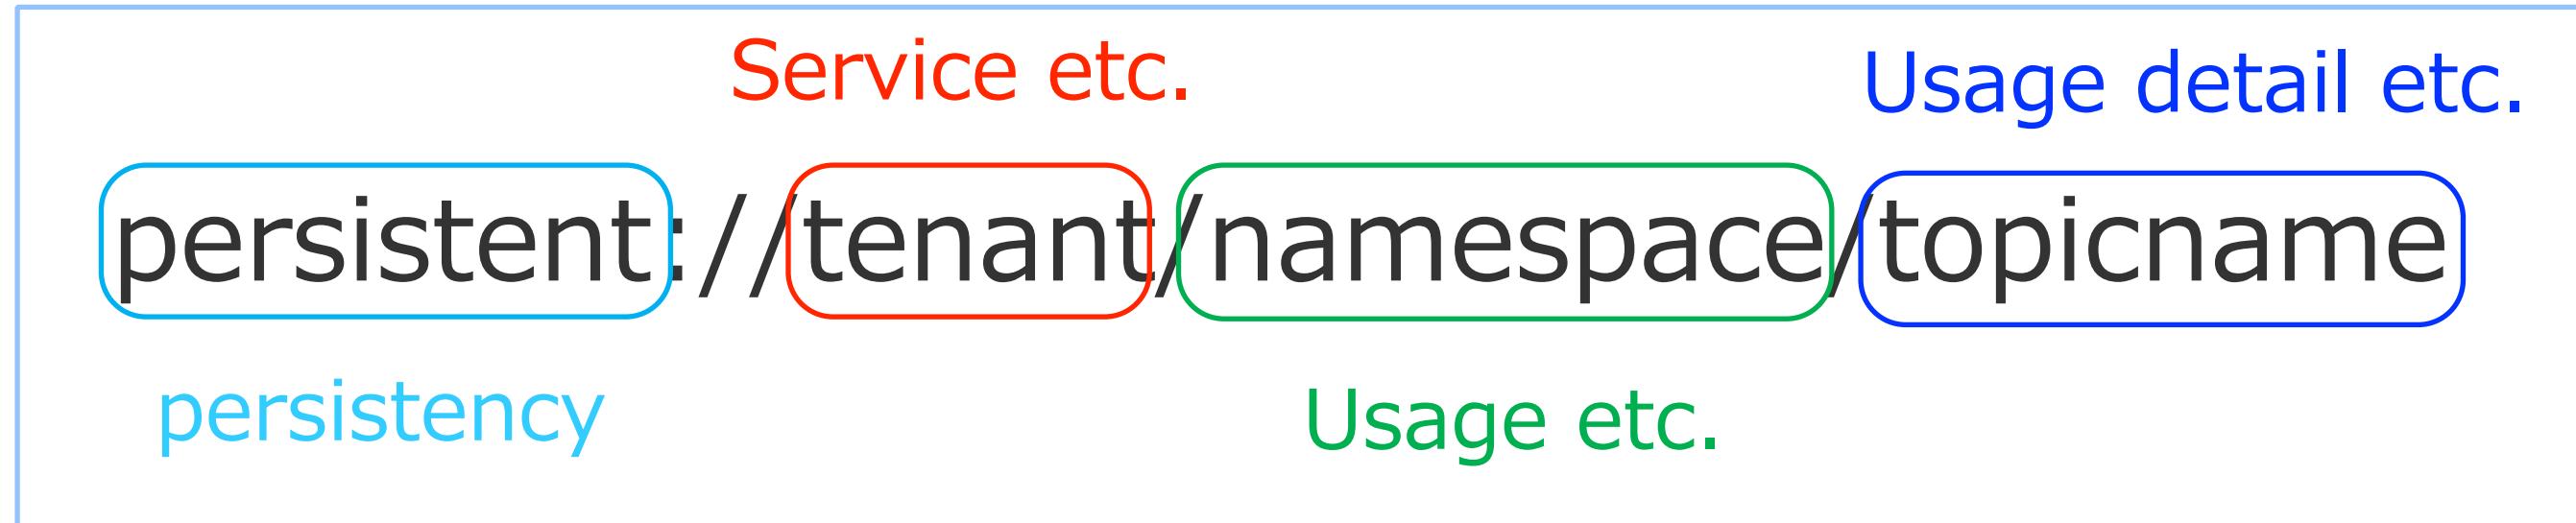

C++

Python

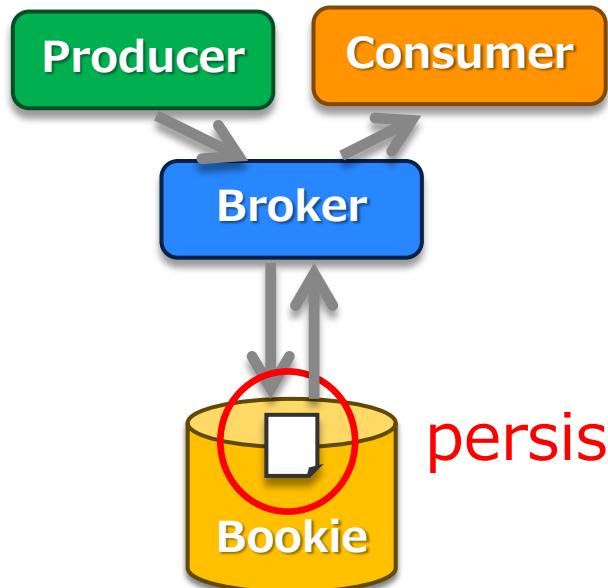

Go

Also can use **WebSocket API**

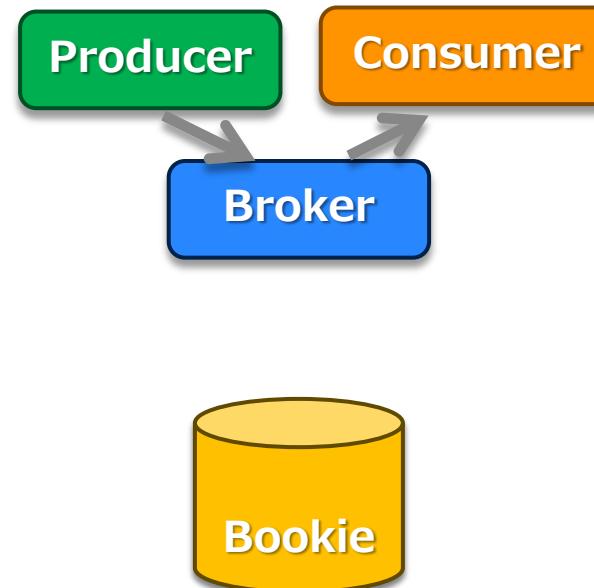

Topic URI

persistent

non-persistent

Examples:

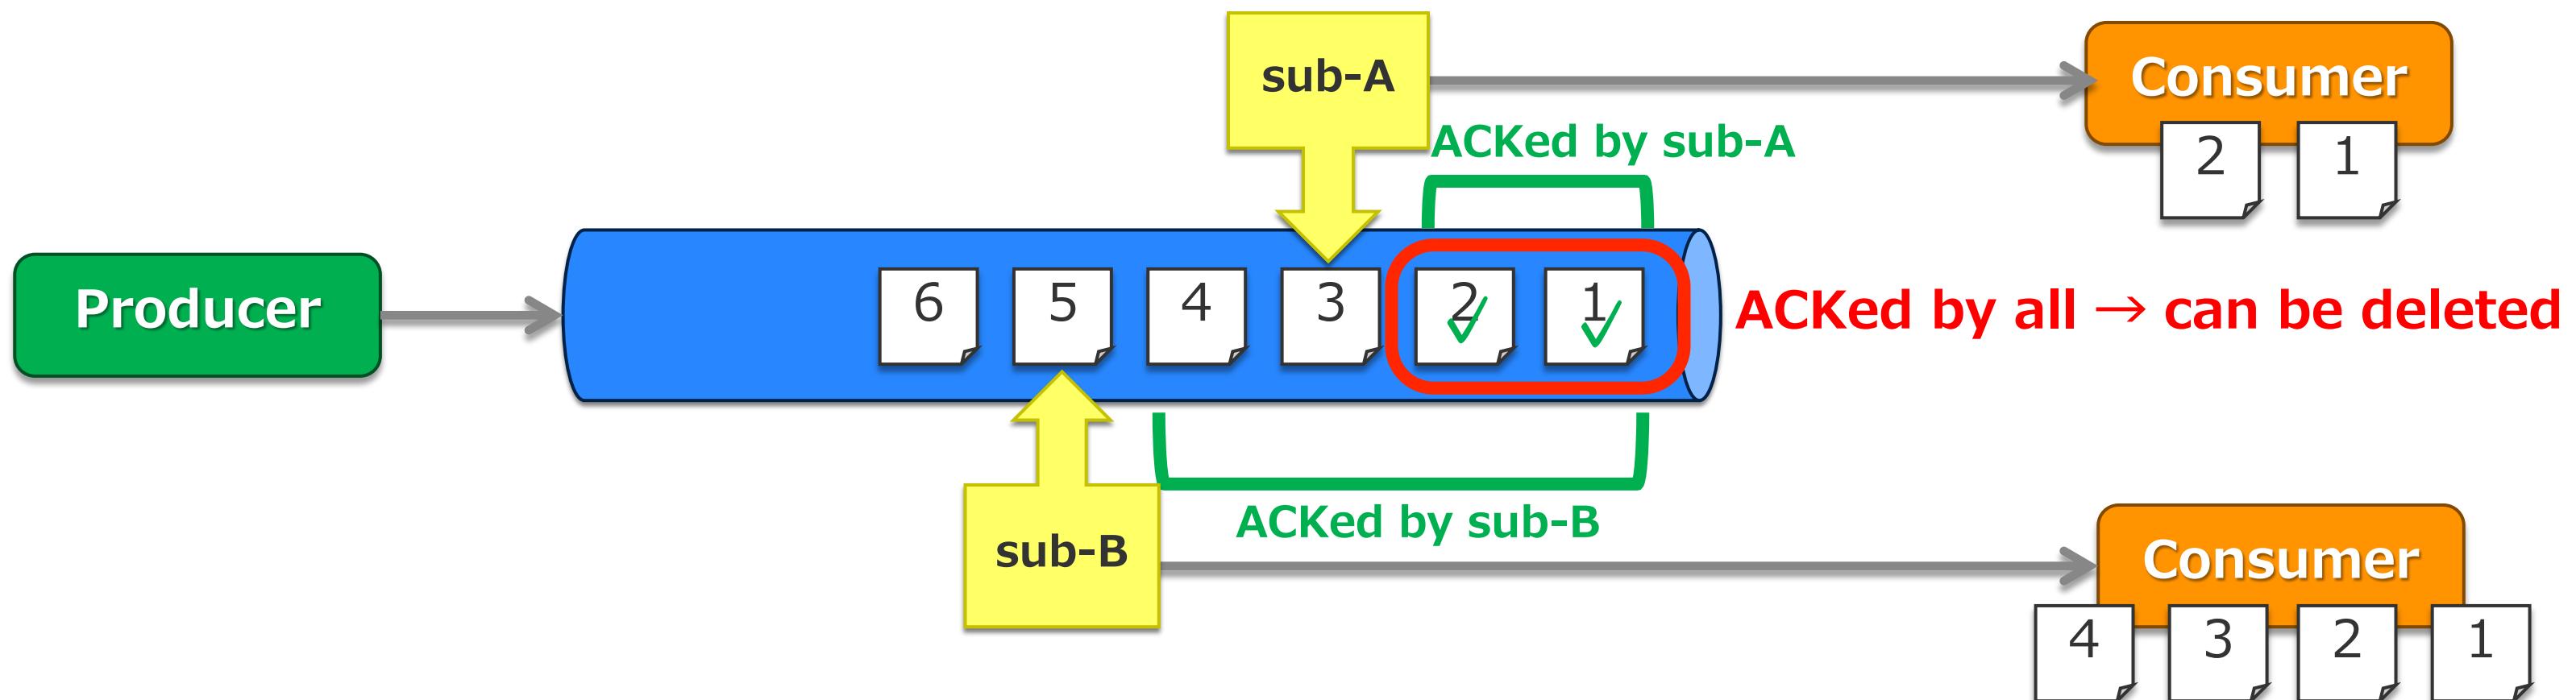

persistent://shopping/user-log/buy
persistent://auction/notifications/bid
persistent://news/sports/articles

...

Subscription

- **Acknowledgement(ACK)**: confirmation that message is received
- **Cursor**: which messages are acknowledged
- **Subscription**: cursor and which consumers are connecting

Note: Each message is kept unless all subscriptions acknowledge

Sample code(Java) - Producer

```
// Create client by specifying the broker URI
PulsarClient client = PulsarClient.builder()
    .serviceUrl("pulsar://localhost:6650")
    .build();

// Create producer by specifying the topic URI
Producer<byte[]> producer = client.newProducer()
    .topic("persistent://my-tenant/my-ns/my-topic")
    .create();

// Send a message
producer.send("My message".getBytes());
```

Sample code(Java) - Consumer

```
// Create client by specifying the broker URI
PulsarClient client = PulsarClient.builder()
    .serviceUrl("pulsar://localhost:6650")
    .build();

// Create consumer by specifying the topic URI and subscription name
Consumer consumer = client.newConsumer()
    .topic(" persistent://my-tenant/my-ns/my-topic")
    .subscriptionName("my-subscription")
    .subscribe();

// Receive a message
Message msg = consumer.receive();
System.out.printf("Message received: %s", new String(msg.getData()));

// Acknowledge the message so that it can be deleted by the broker
consumer.acknowledge(msg);
```

Why is Apache Pulsar useful?

Agenda

1. What is Apache Pulsar?

2. Why is Apache Pulsar useful?

- › High performance
- › Scalability
- › Multi-tenant
- › Geo-replication
- › Pulsar Functions
- › Pulsar on Kubernetes
- › Apache Pulsar vs. Apache Kafka

3. How does Yahoo! JAPAN uses Apache Pulsar?

High performance

High throughput & low latency even if

huge number of topics
high reliability is required

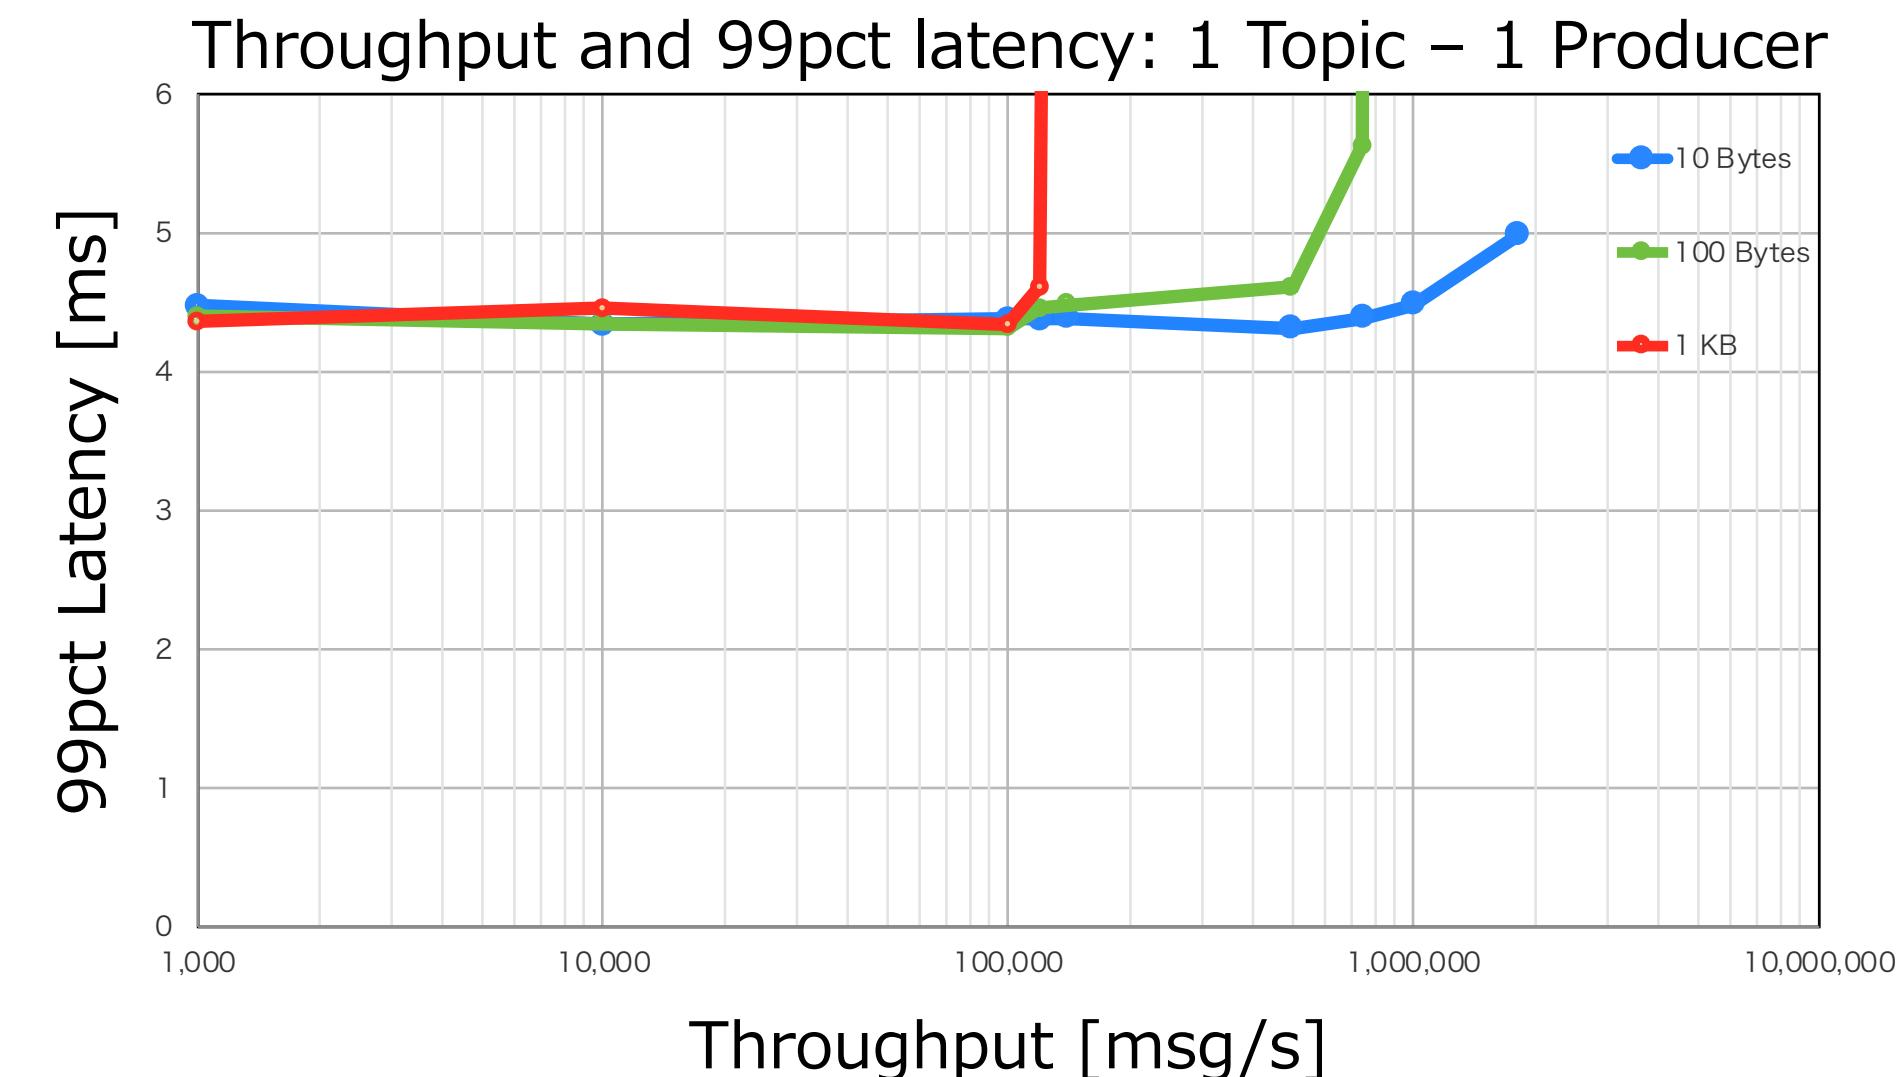

ex. At Oath Inc.

Requirements:

- Topics: **2.3 million**
- Messages : **100 billion [msg/day]**
- Message loss is not acceptable
- Order needs to be guaranteed

Performance(1KB message):

- Throughput: **100 thousand [msg/s]**
- Latency: **5 [ms]**

Graph is from:

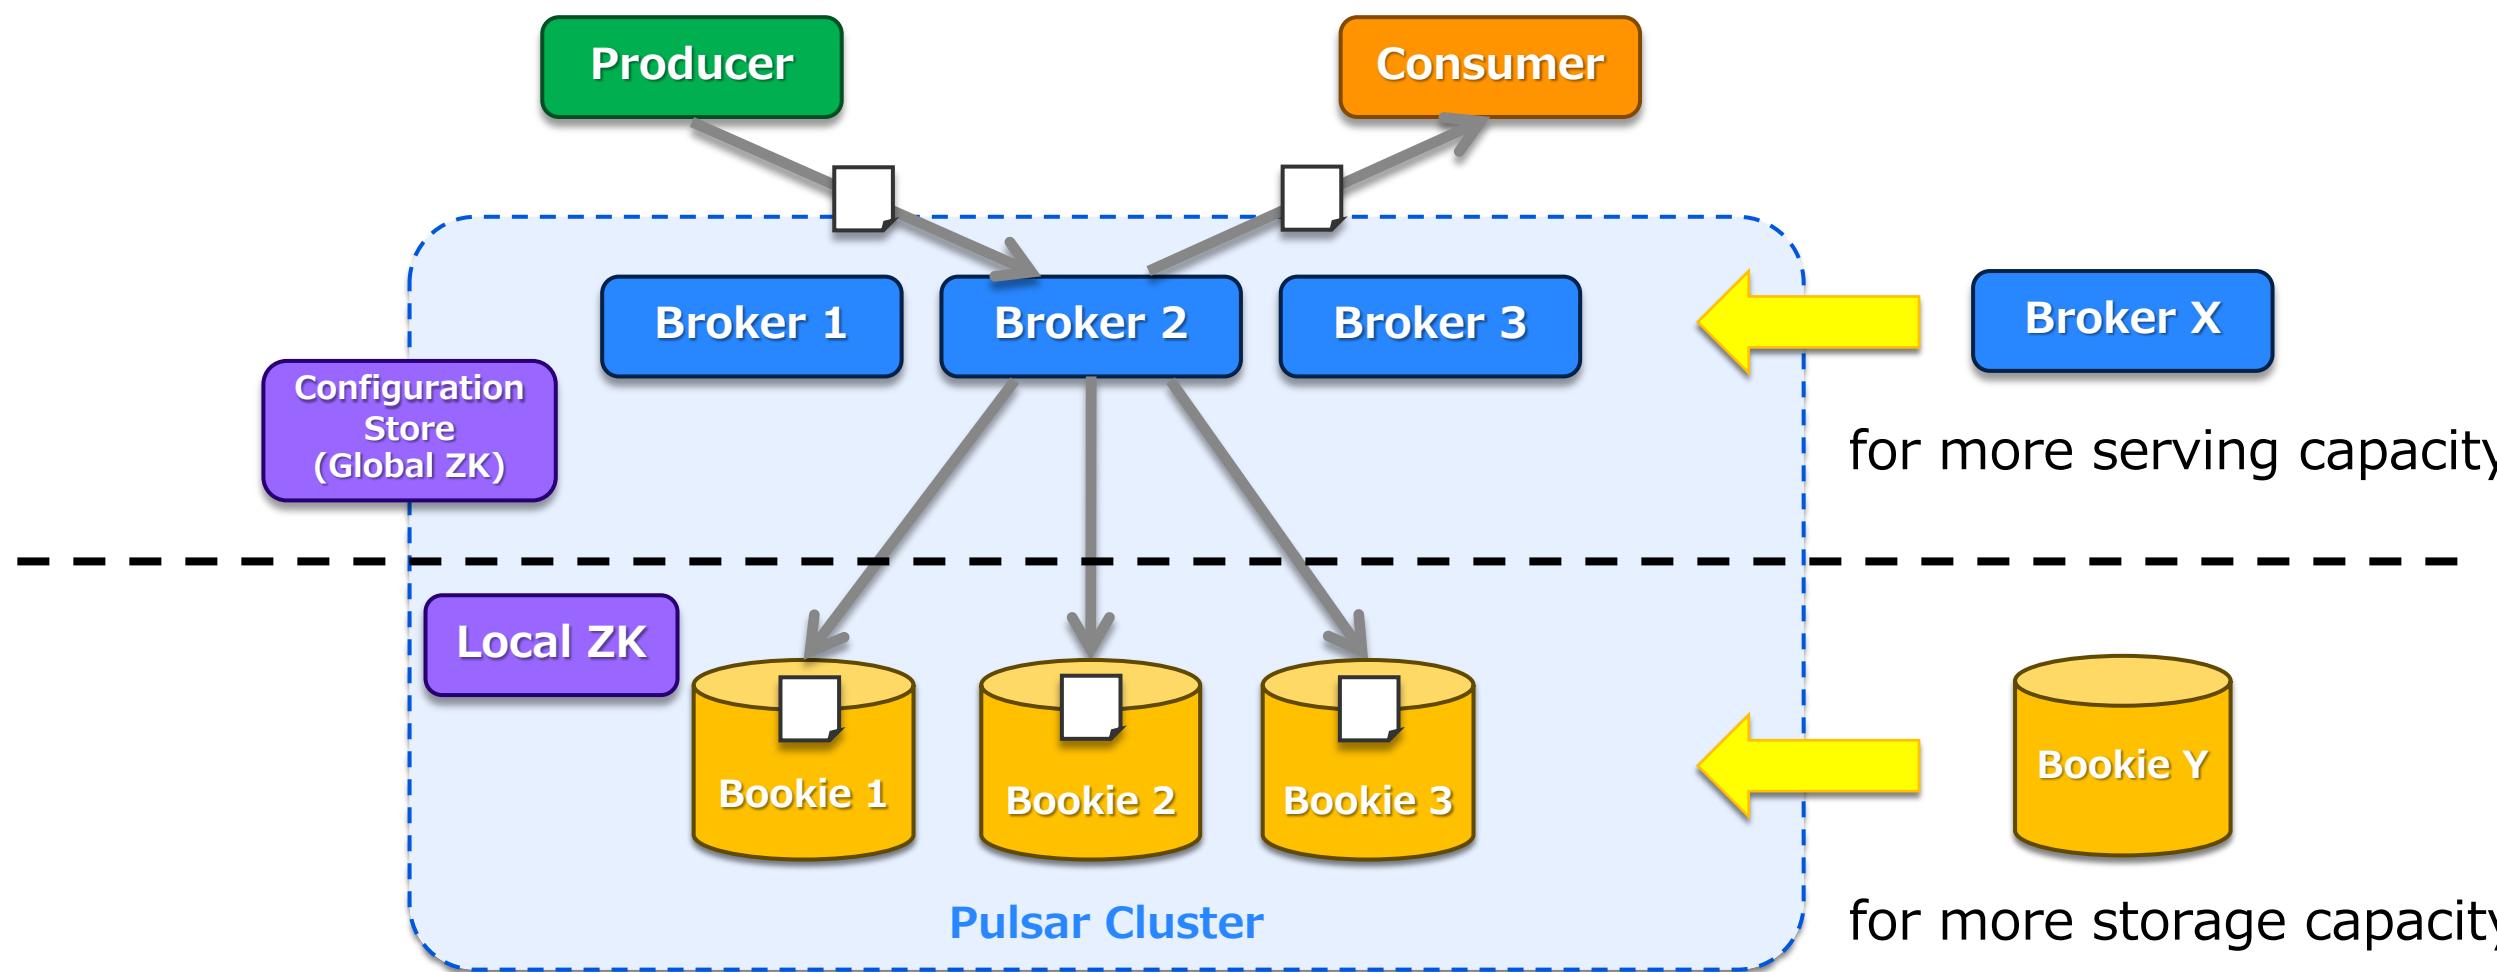

[https://yahooeng.tumblr.com/post/150078336821/
open-sourcing-pulsar-pub-sub-messaging-at-scale](https://yahooeng.tumblr.com/post/150078336821/open-sourcing-pulsar-pub-sub-messaging-at-scale)

Scalability

Just adding Brokers/Bookies increases serving/storage capacity

Add Brokers when more producer/consumer's requests need to be served

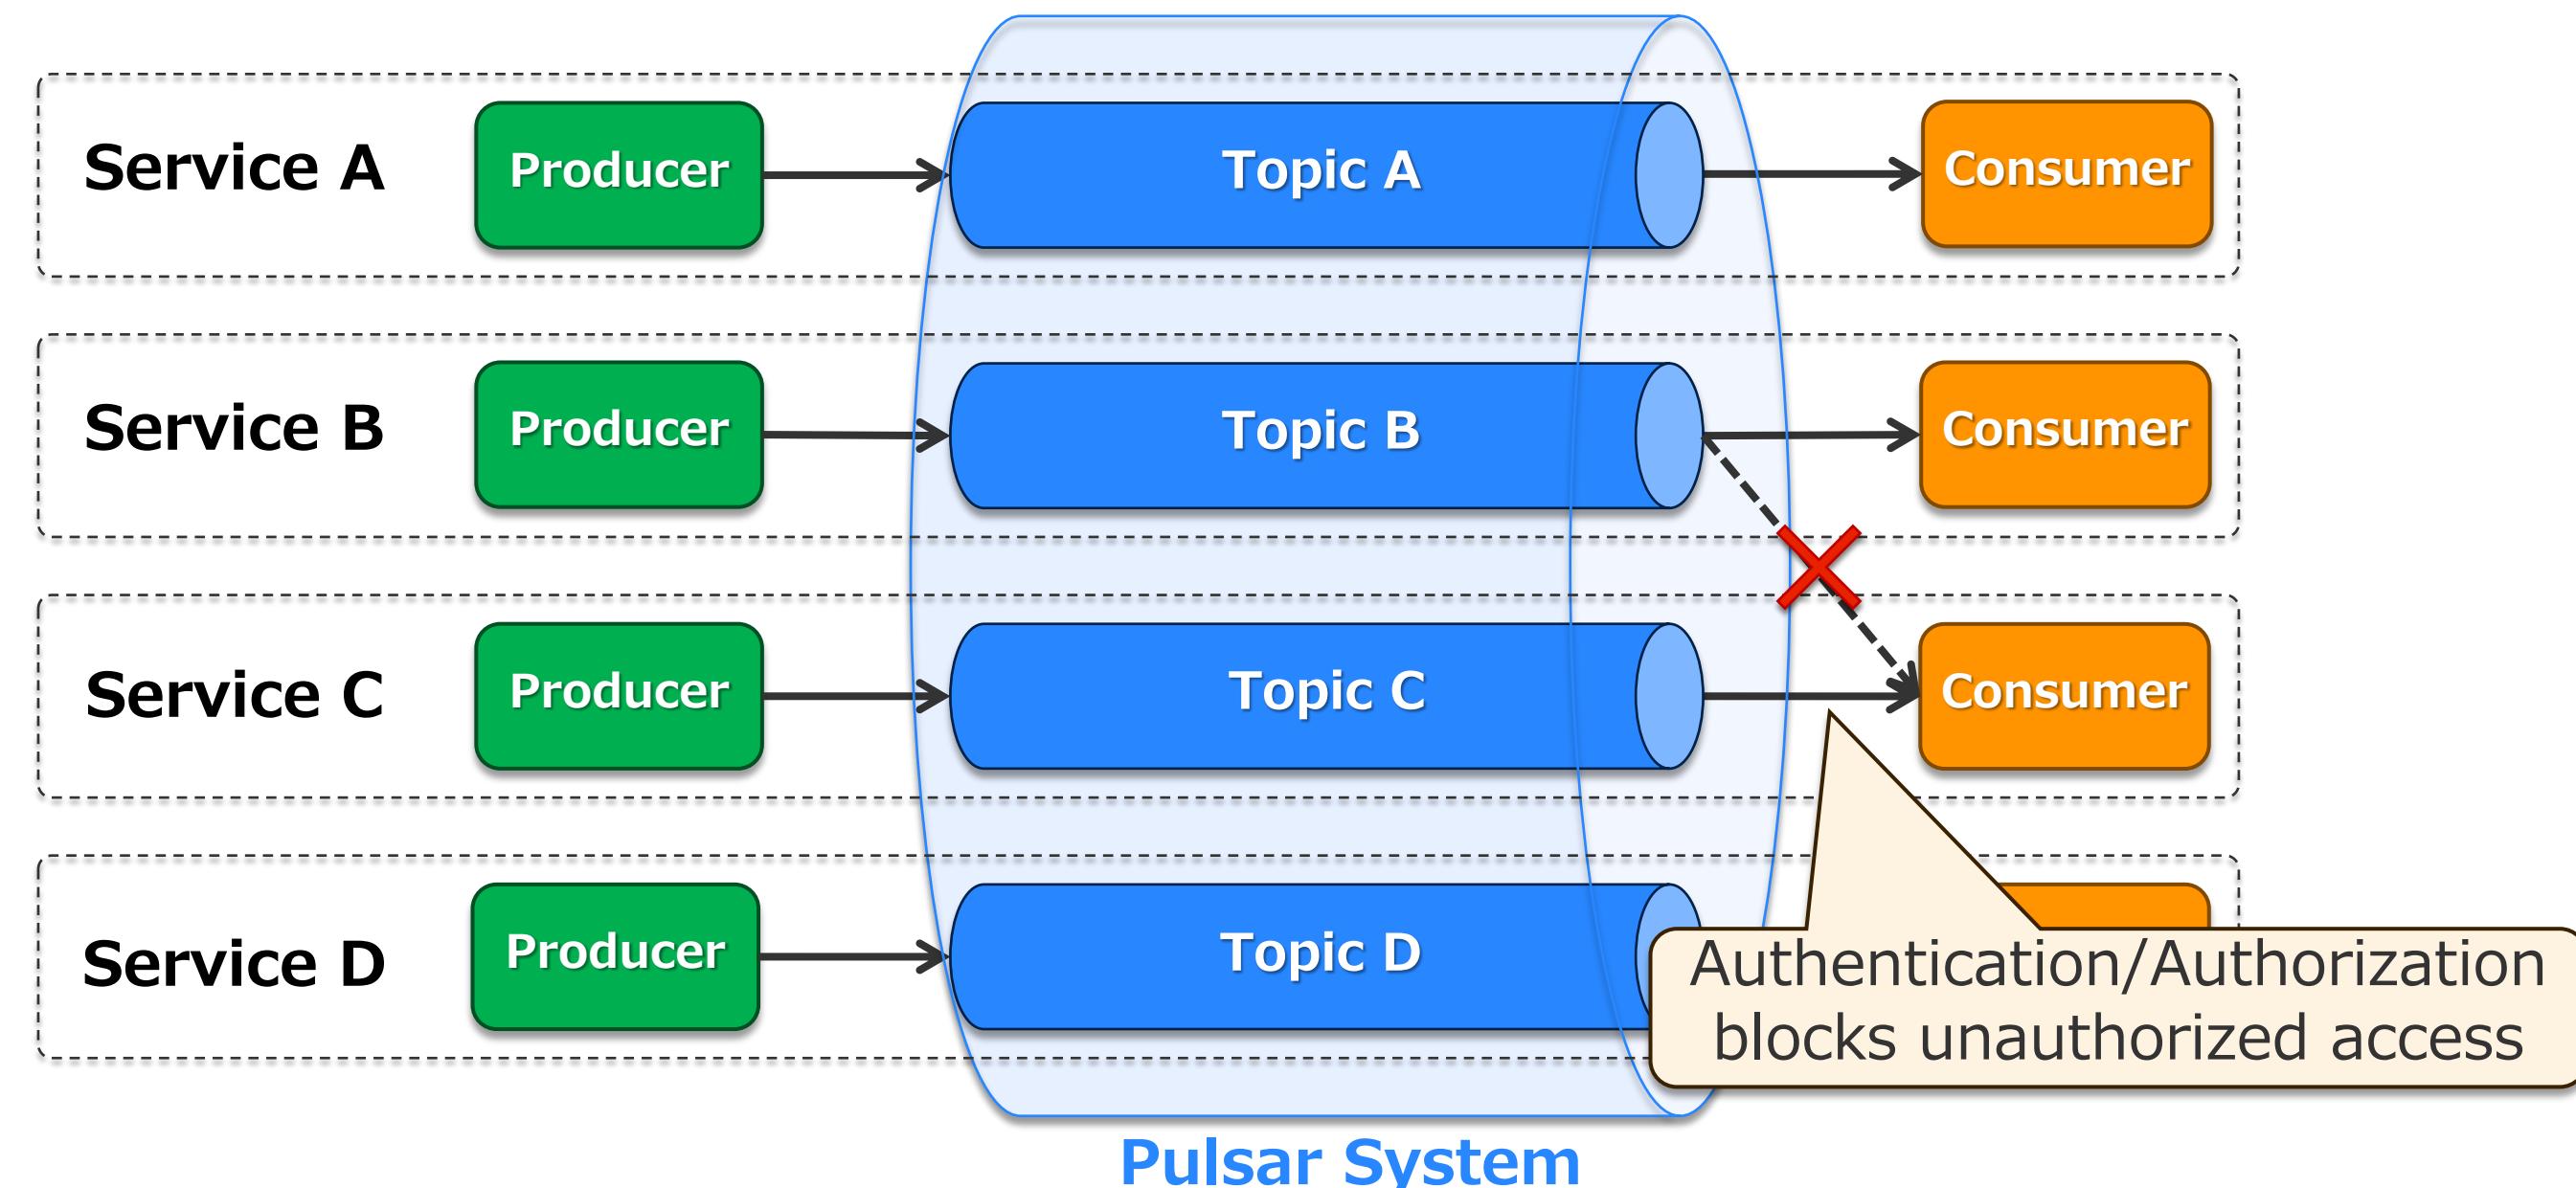

Add Bookies when more messages need to be stored

Multi-tenancy

Multiple services can share one Pulsar system

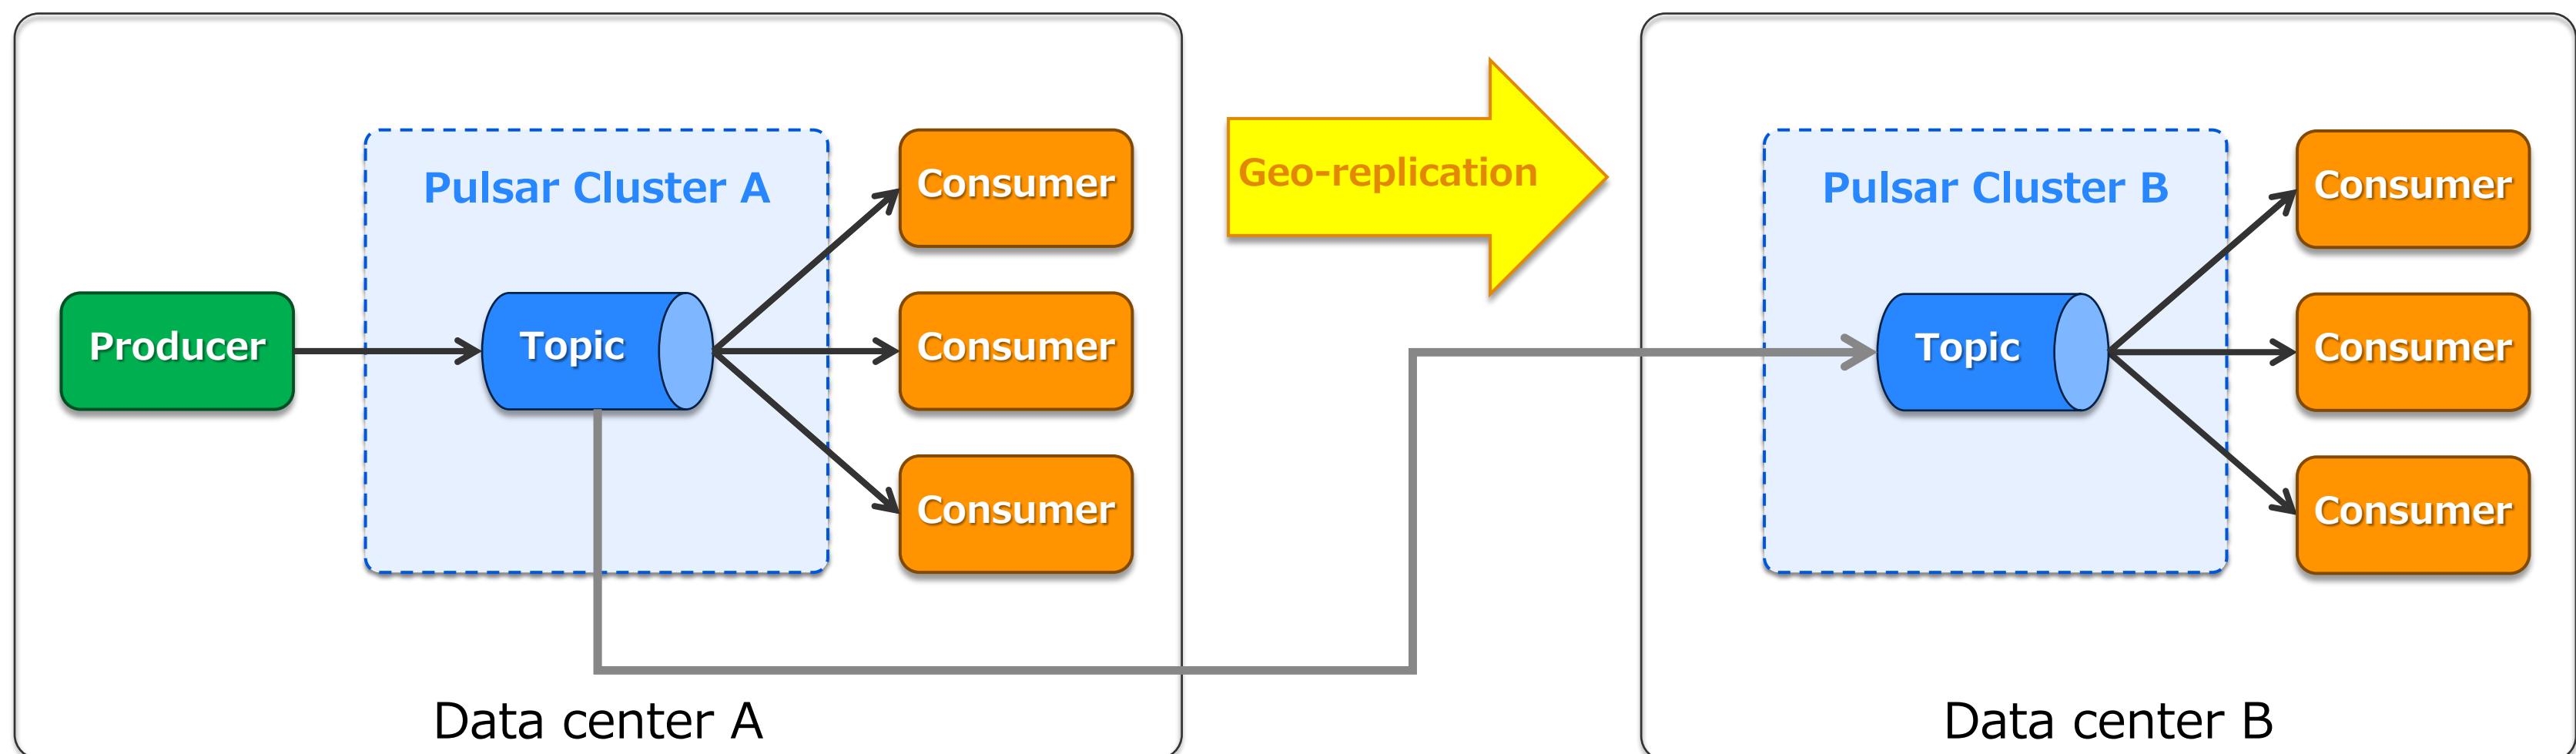

Just use Pulsar as a “Tenant” → no need to maintain own messaging system
Authentication/Authorization mechanism protects messages from interception

Geo-replication

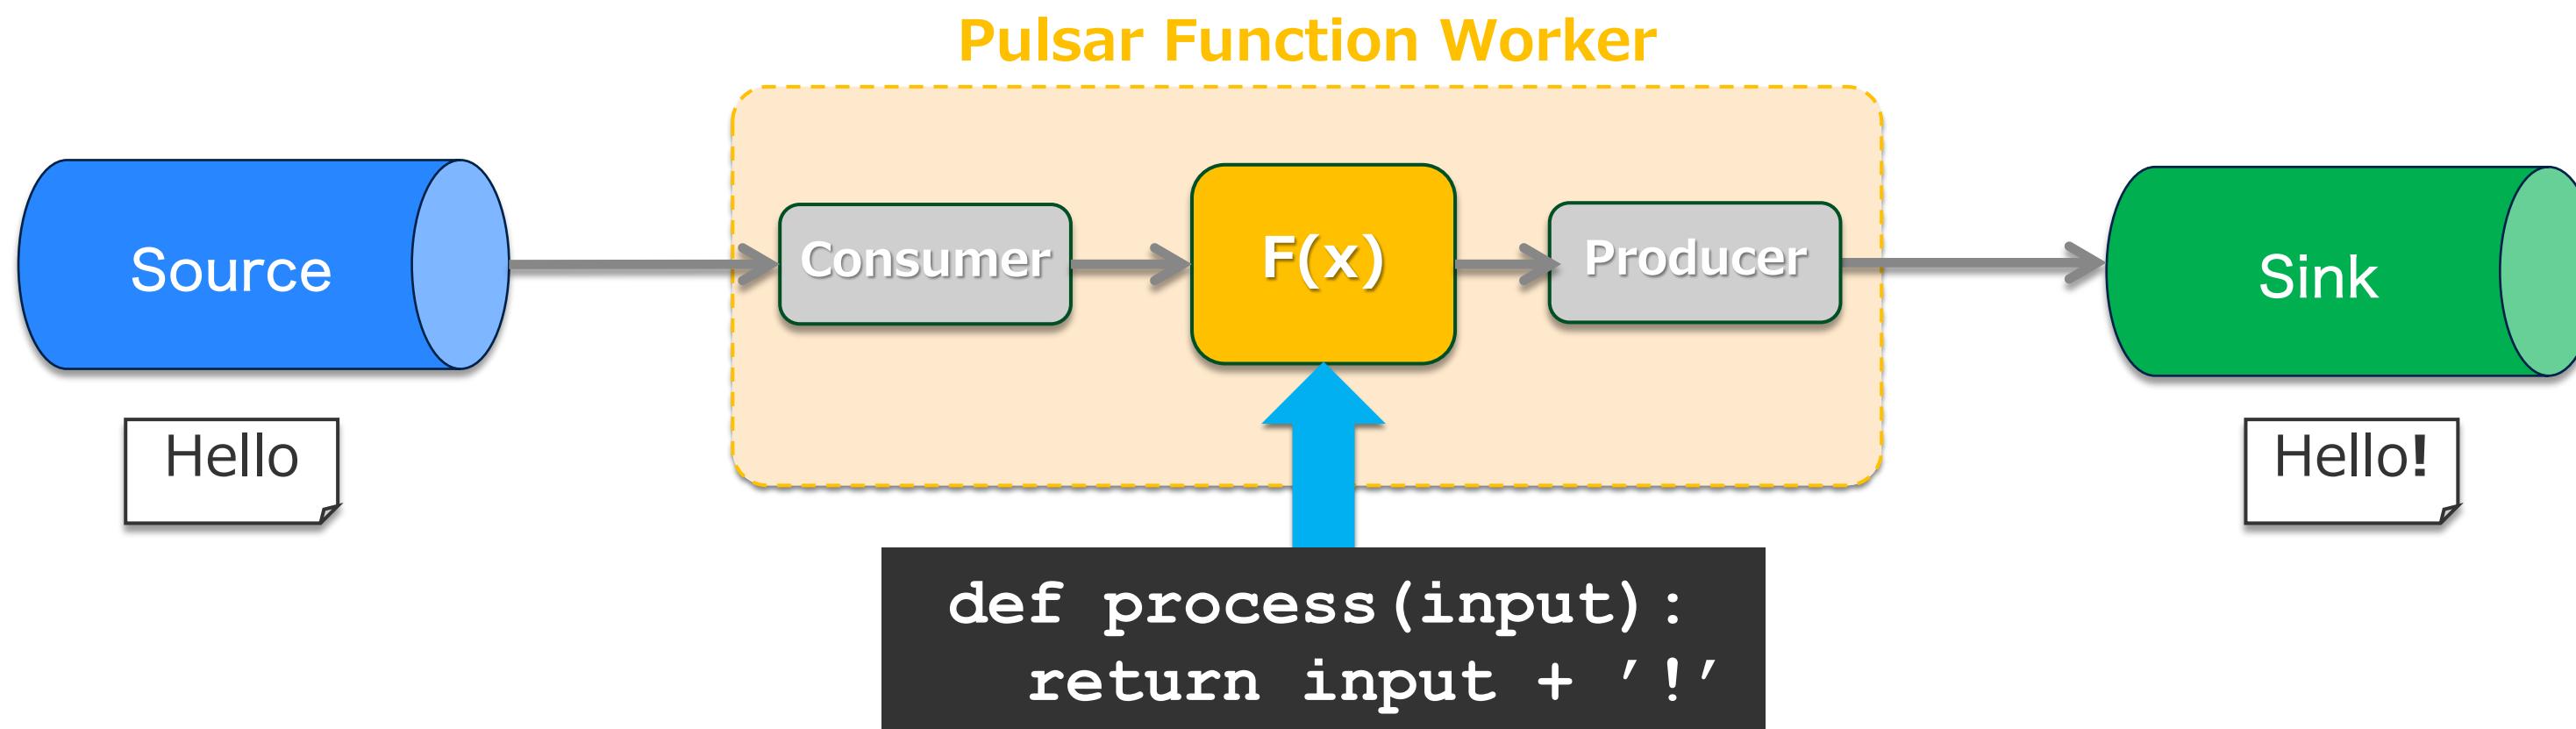

Pulsar can replicate messages to another cluster

1. Producers only have to publish messages to Pulsar in the same data center
2. Pulsar asynchronously replicates messages to another cluster
3. Consumers can receive messages from the same data center

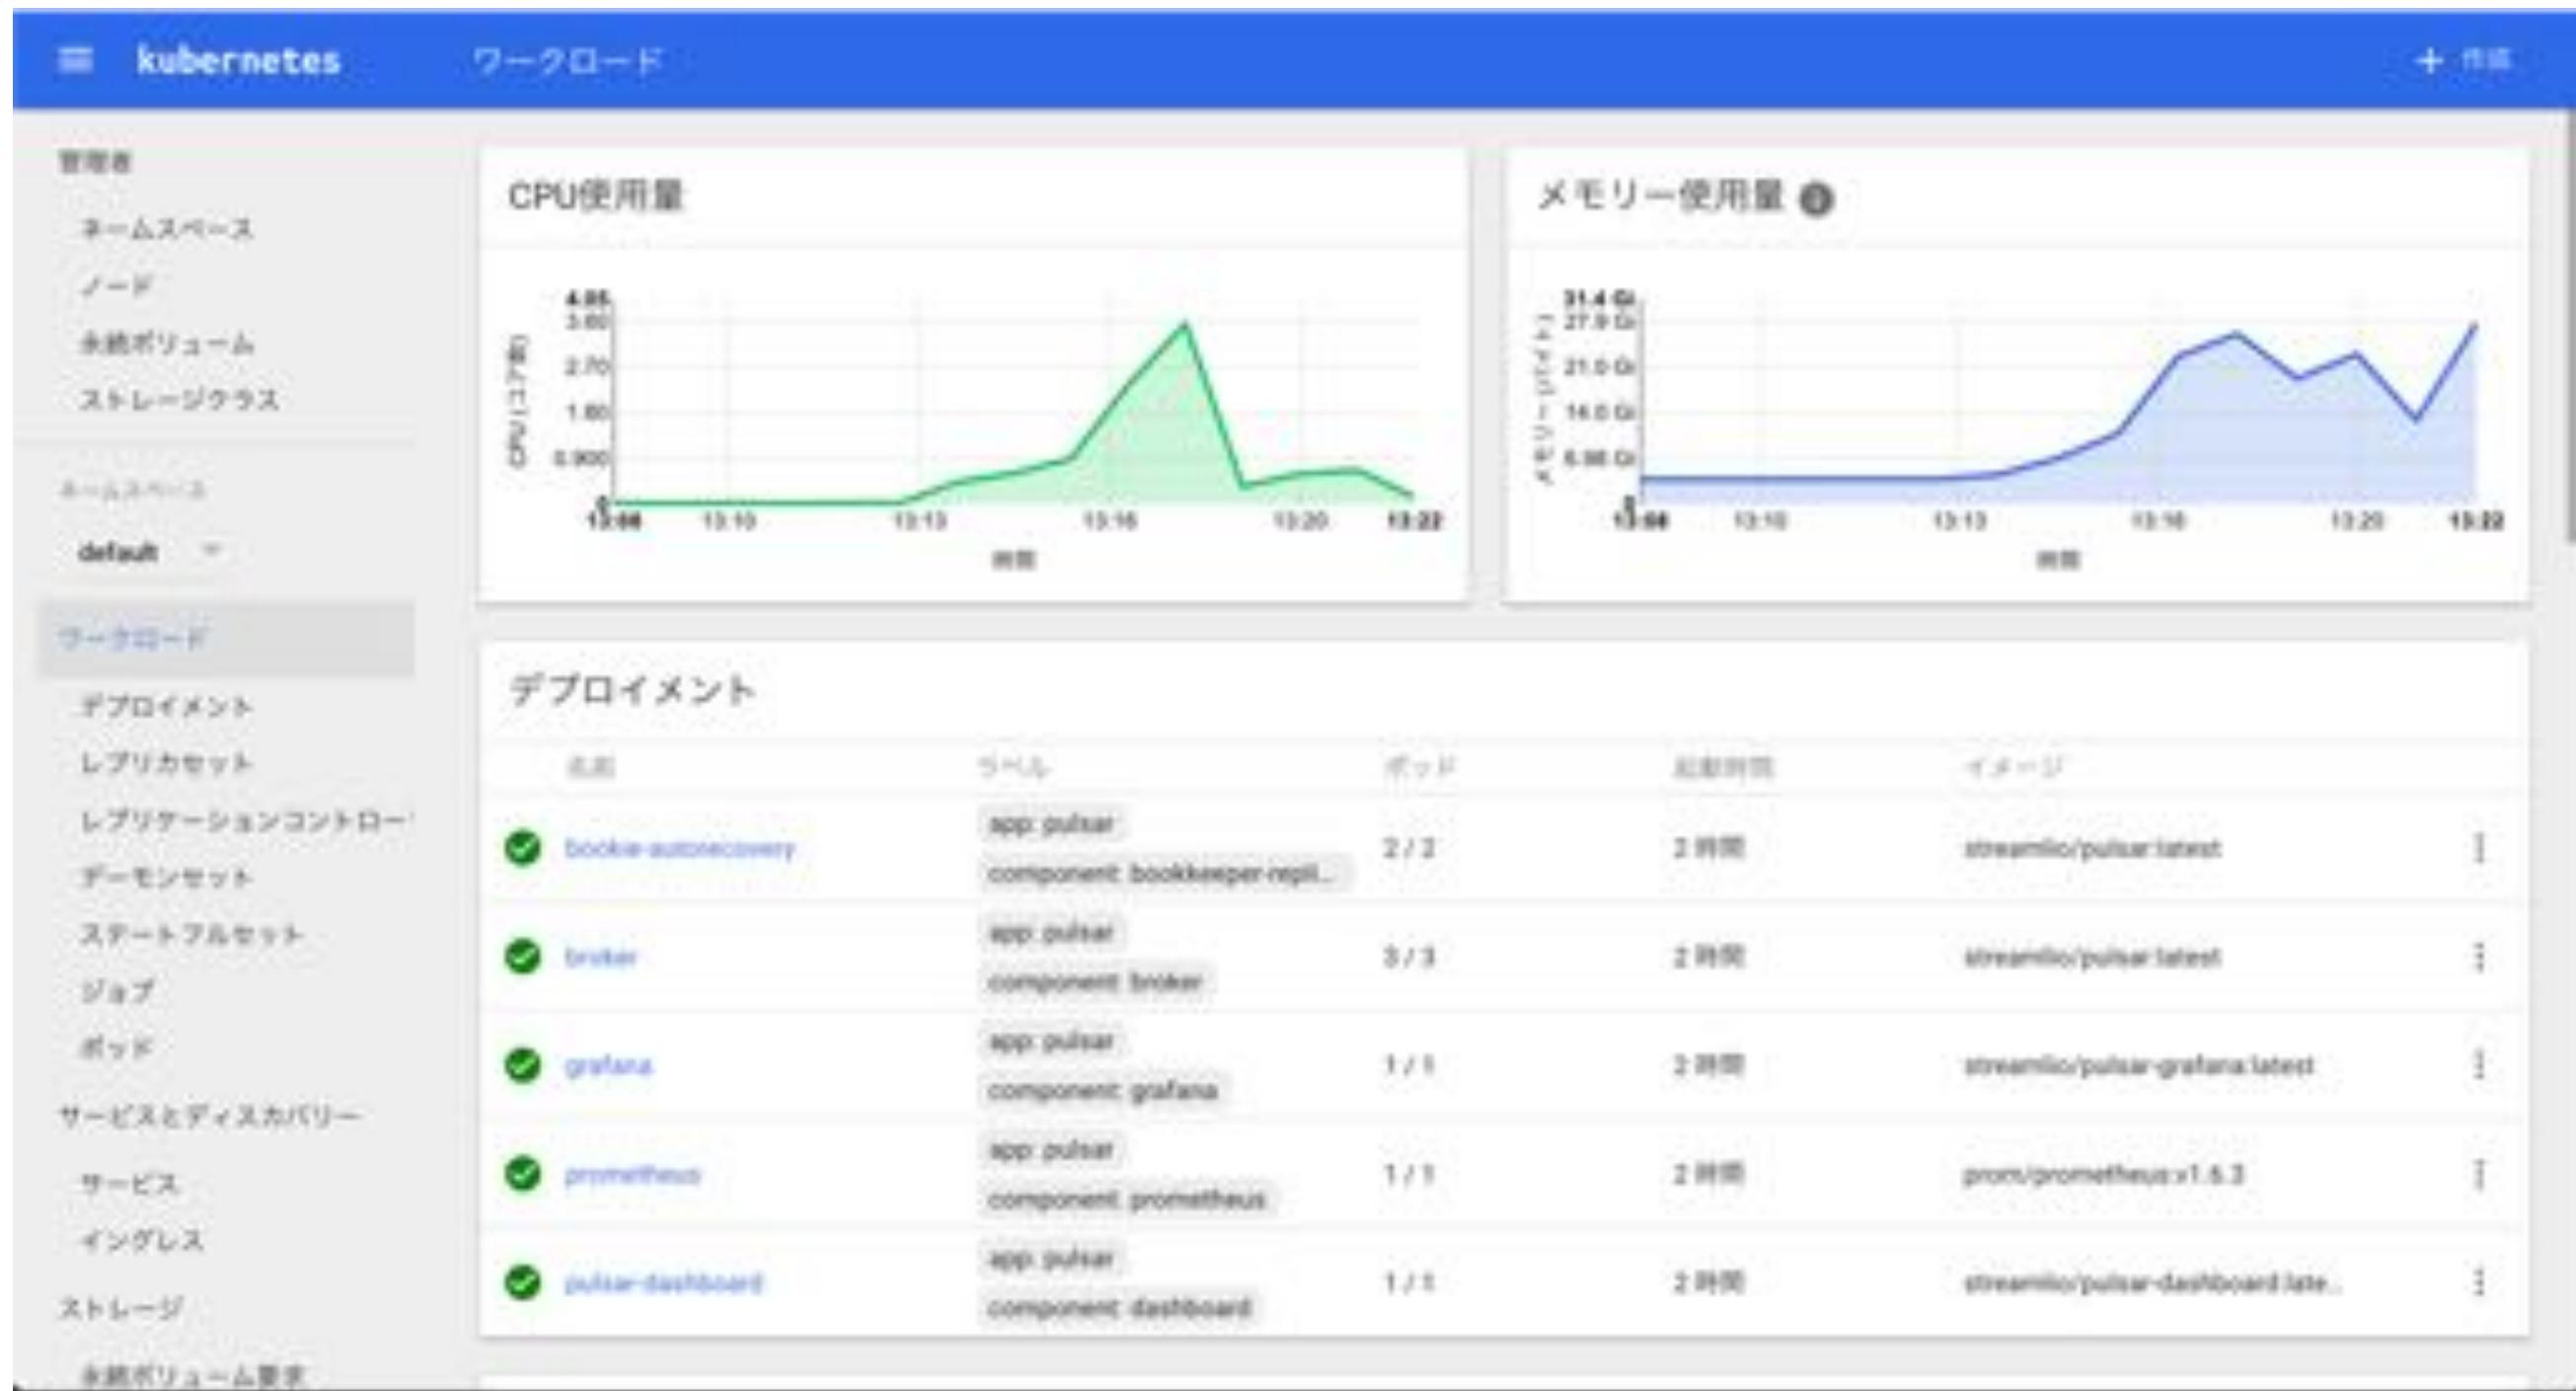

Pulsar Functions

- **Lightweight compute framework** (e.g., AWS Lambda, Google Cloud Functions)
- **No need to launch extra systems** (e.g., Apache Heron, Apache Storm, Apache Spark)
- All you have to do is to implement your logic and deploy it to Pulsar cluster
- Java and Python are available and also other languages will be supported in the future

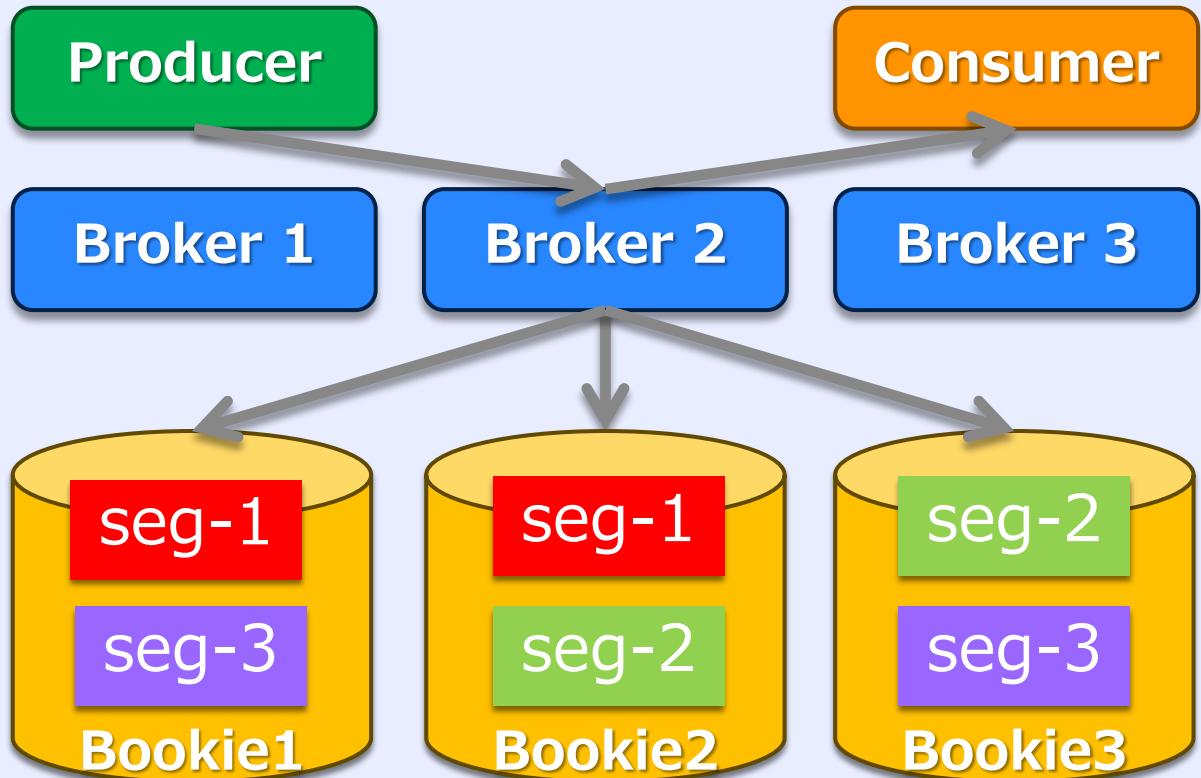

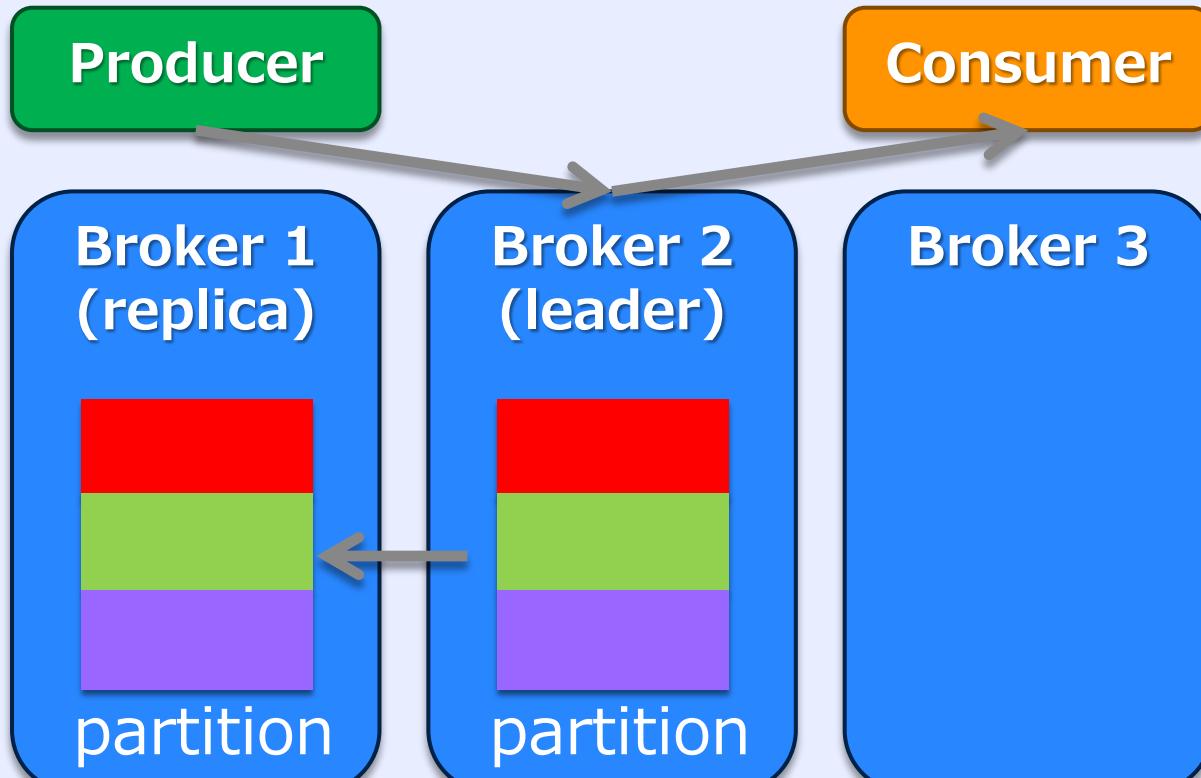

Pulsar on Kubernetes

- Pulsar can be easily deployed in Kubernetes clusters (e.g., AWS, GKE)
- See <https://pulsar.incubator.apache.org/docs/latest/deployment/Kubernetes/>

Apache Pulsar vs. Apache Kafka

	Apache Pulsar	Apache Kafka
Architecture image:	<ul style="list-style-type: none"> • # of partition=1 • # of storage=3 • # of replication=2  <pre> graph LR Producer[Producer] --> Broker1[Broker 1] Producer --> Broker2[Broker 2] Producer --> Broker3[Broker 3] Broker1 --> Bookie1[Bookie1] Broker2 --> Bookie1 Broker2 --> Bookie2[Bookie2] Broker3 --> Bookie3[Bookie3] Bookie1 --> Seg1_1[seg-1] Bookie1 --> Seg3_1[seg-3] Bookie2 --> Seg1_2[seg-1] Bookie2 --> Seg2_2[seg-2] Bookie3 --> Seg2_3[seg-2] Bookie3 --> Seg3_3[seg-3] </pre>	 <pre> graph LR Producer[Producer] --> Broker1["Broker 1 (replica)"] Producer --> Broker2["Broker 2 (leader)"] Producer --> Broker3[Broker 3] Broker1 --> Partition1[partition] Broker2 --> Partition2[partition] Broker3 --> Partition3[partition] Partition1 --> Seg1_1[seg-1] Partition1 --> Seg3_1[seg-3] Partition2 --> Seg1_2[seg-1] Partition2 --> Seg2_2[seg-2] Partition3 --> Seg2_3[seg-2] Partition3 --> Seg3_3[seg-3] </pre>
Replication unit	Segment (smaller than Partition)	Partition
Data distribution	Distributed and balanced across all Bookies	Kept in only leader and replica Brokers
Max capacity	Not limited by any single node	Limited by the smallest broker's capacity
Data Rebalancing when scale	Not required	Required
Geo-replication	Built-in	Need to start an extra process: MirrorMaker

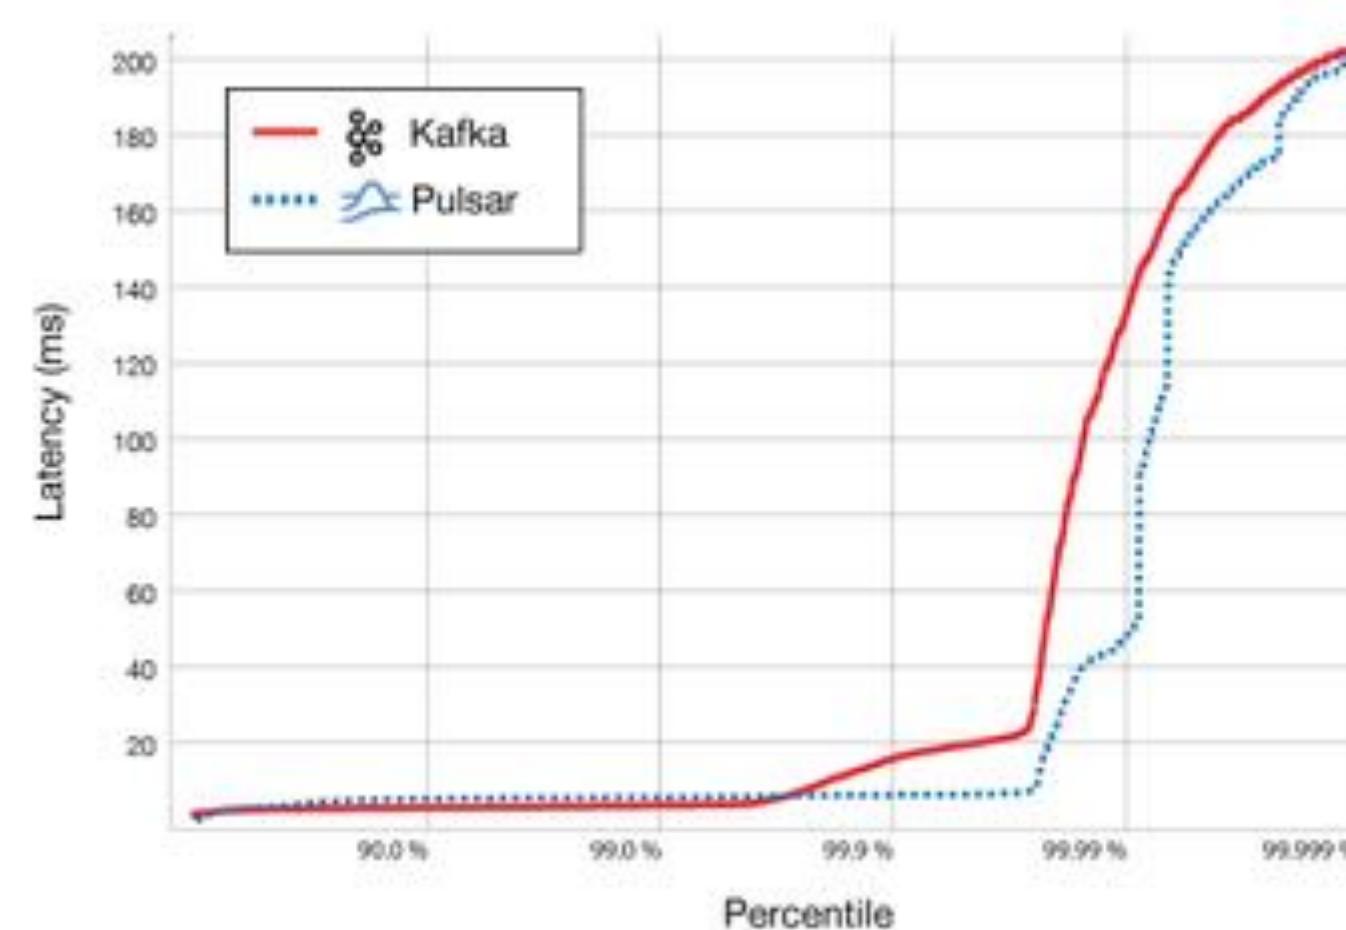

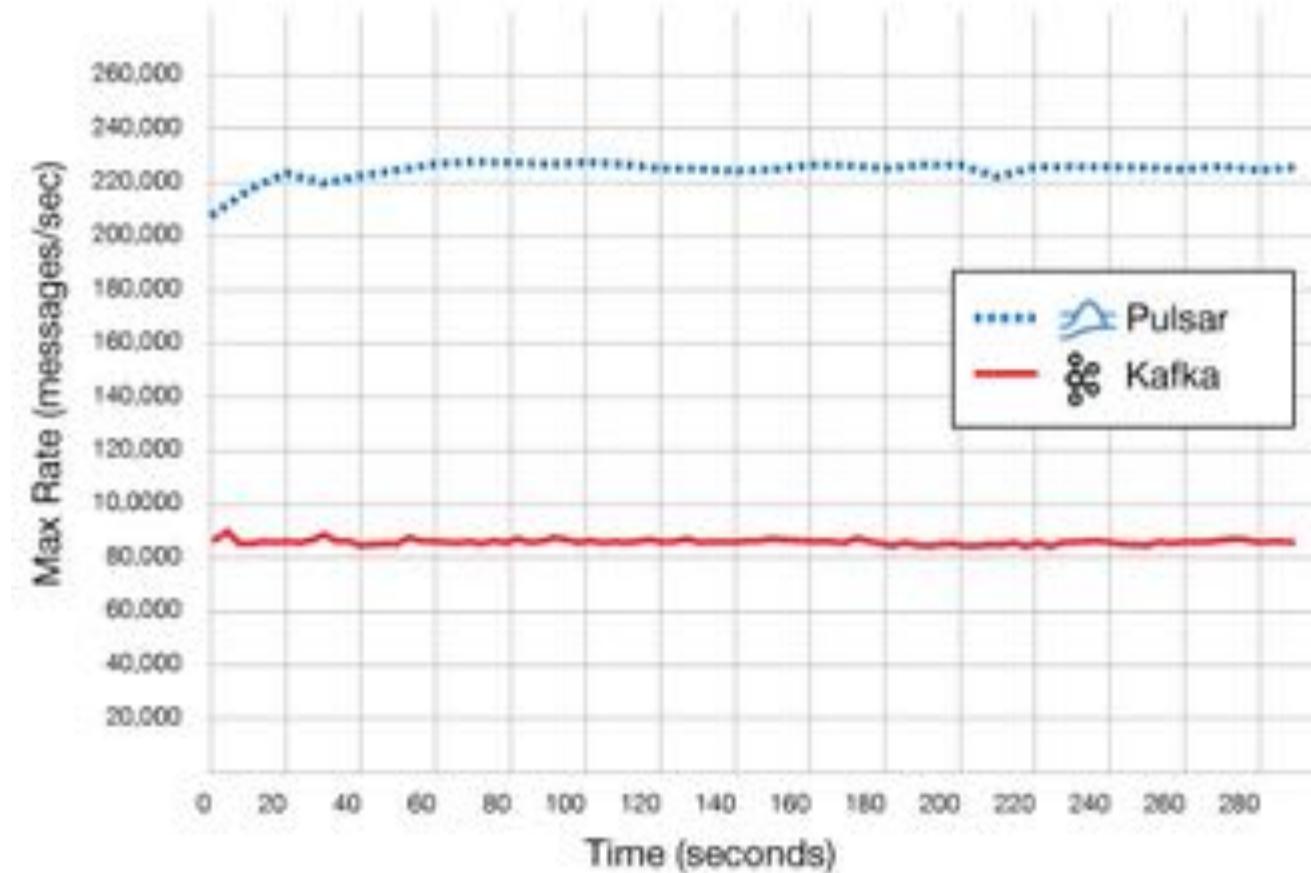

OpenMessaging Benchmark

<http://openmessaging.cloud/docs/benchmarks/>

- A suite of tools that can easily compare various messaging systems

<https://info.stream.io/benchmarking-streaming-messaging-platforms>

- Pulsar showed better performance than Kafka

How does Yahoo! JAPAN use Apache Pulsar?

71,300,000,000

**PV/month
(average in 2017)**

Why Yahoo! JAPAN chose Pulsar?

Large number of users

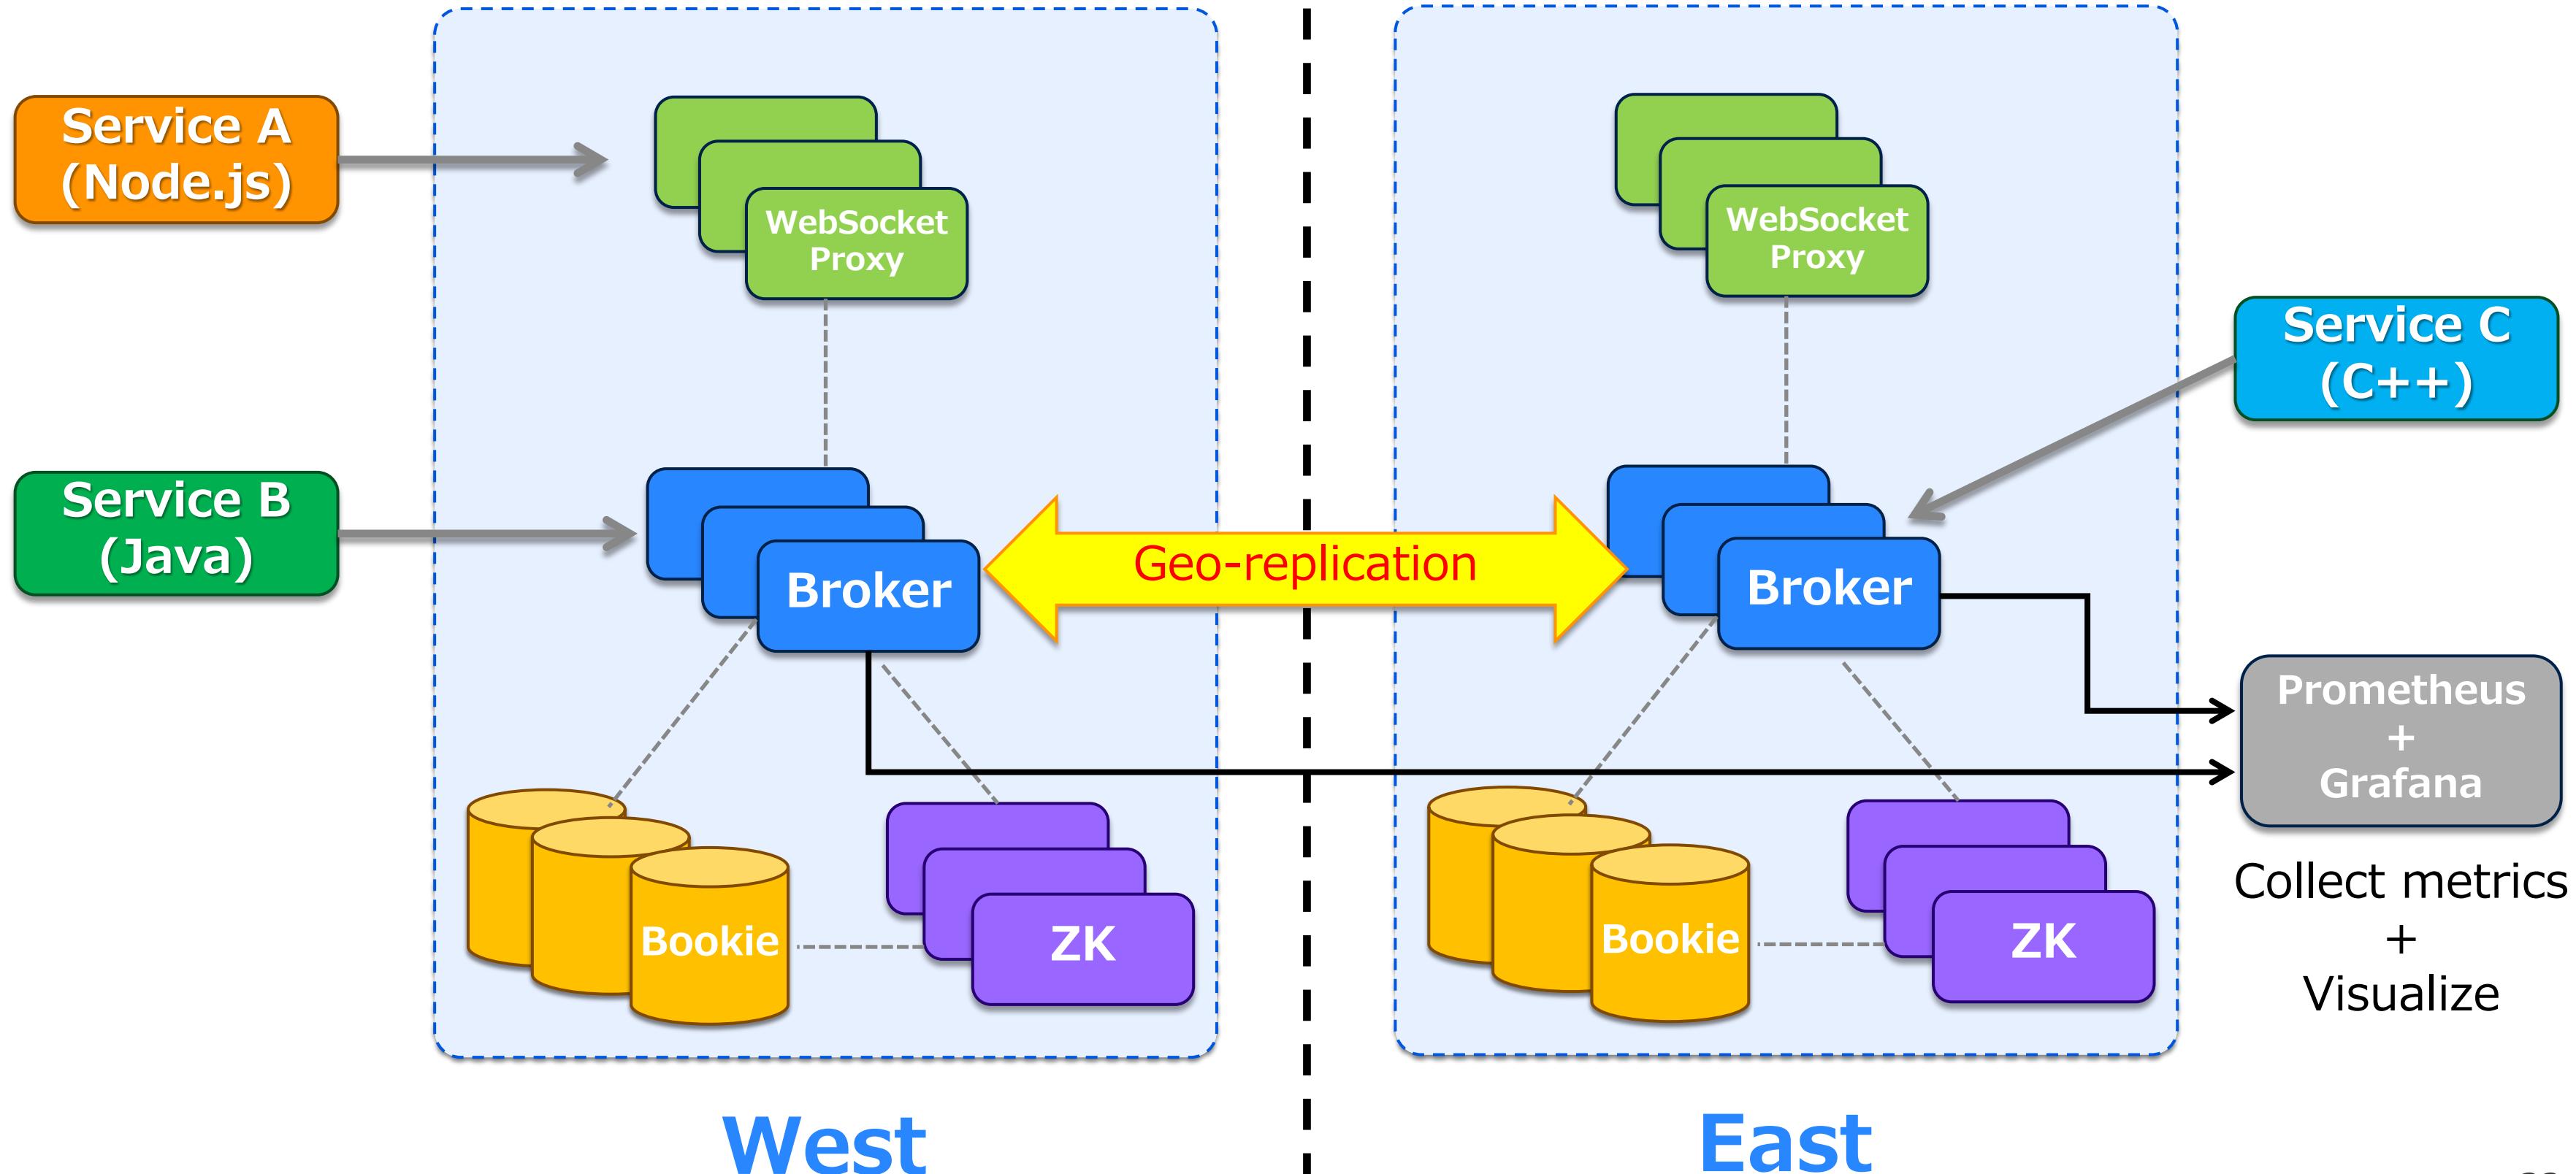

Large number of services

Sensitive/mission-critical messages

Multiple data centers

Pulsar meets all these requirements!

System architecture in Yahoo! JAPAN

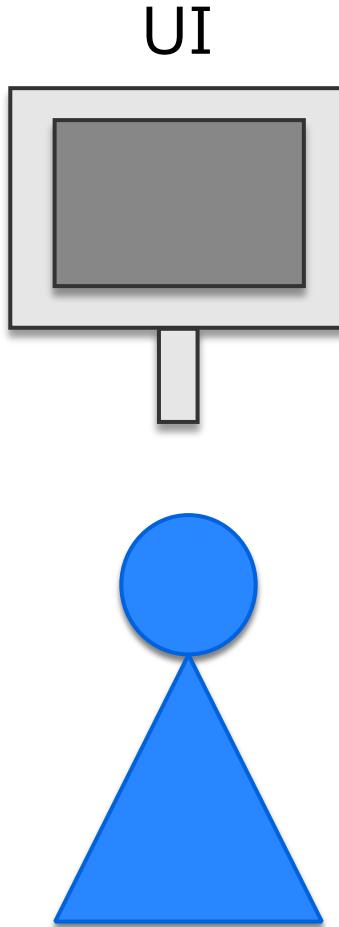

Monitoring by Prometheus

Self-service tool

Web UI to manage tenants, namespaces and topics (Yahoo! JAPAN internal)

UI

Create tenant

プロパティ名 ② test-tenant
半角英数字・ハイフンで3-32文字

ネームスペース名 ② test-ns
半角英数字・ハイフンで1~32文字

produce権限のロール ② producer-role ×
ロールを入力
Athenz認証: \${テナントドメイン}.\${テナントサービス}をカンマ区切り

consume権限のロール ② consumer-role ×
ロールを入力
Athenz認証: \${テナントドメイン}.\${テナントサービス}をカンマ区切り

Create namespace

統計情報 ②

Average msg size	44.22 bytes
Rate in	3.3333854350366 msg/s
Rate out	3.3333880293975 msg/s
Throughput in	147.40230393732 bytes/s
Throughput out	147.40241865996 bytes/s
Producer count	1
Storage size	3.3333854350366 bytes

See topic stats

Case 1 – Notification of contents update

Various contents files are pushed from partner companies to Yahoo! JAPAN
Notification is sent to topic when contents are updated
Once services receive a notification, they then fetch contents from file server

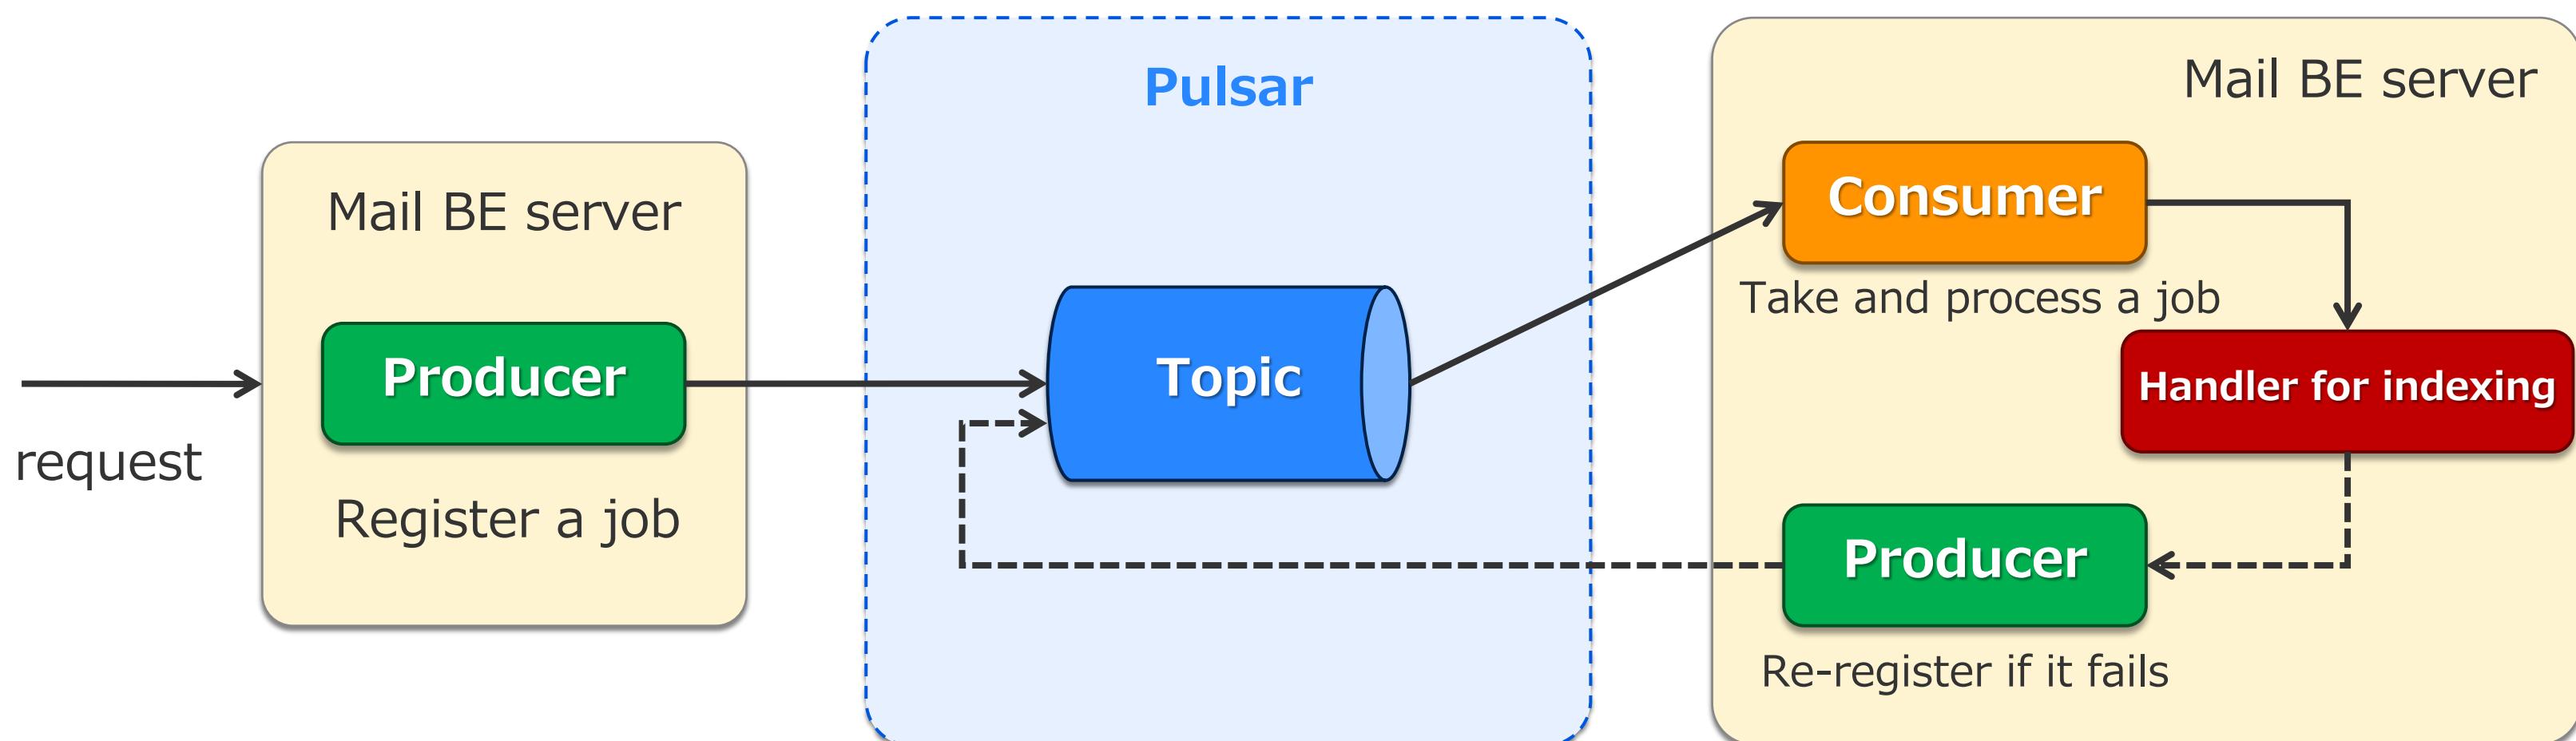

Case 2 – Job queuing in mail service

Indexing of mail can be heavy → let's execute it asynchronously

Producers register jobs to Pulsar

Consumers take jobs from Pulsar at their own pace

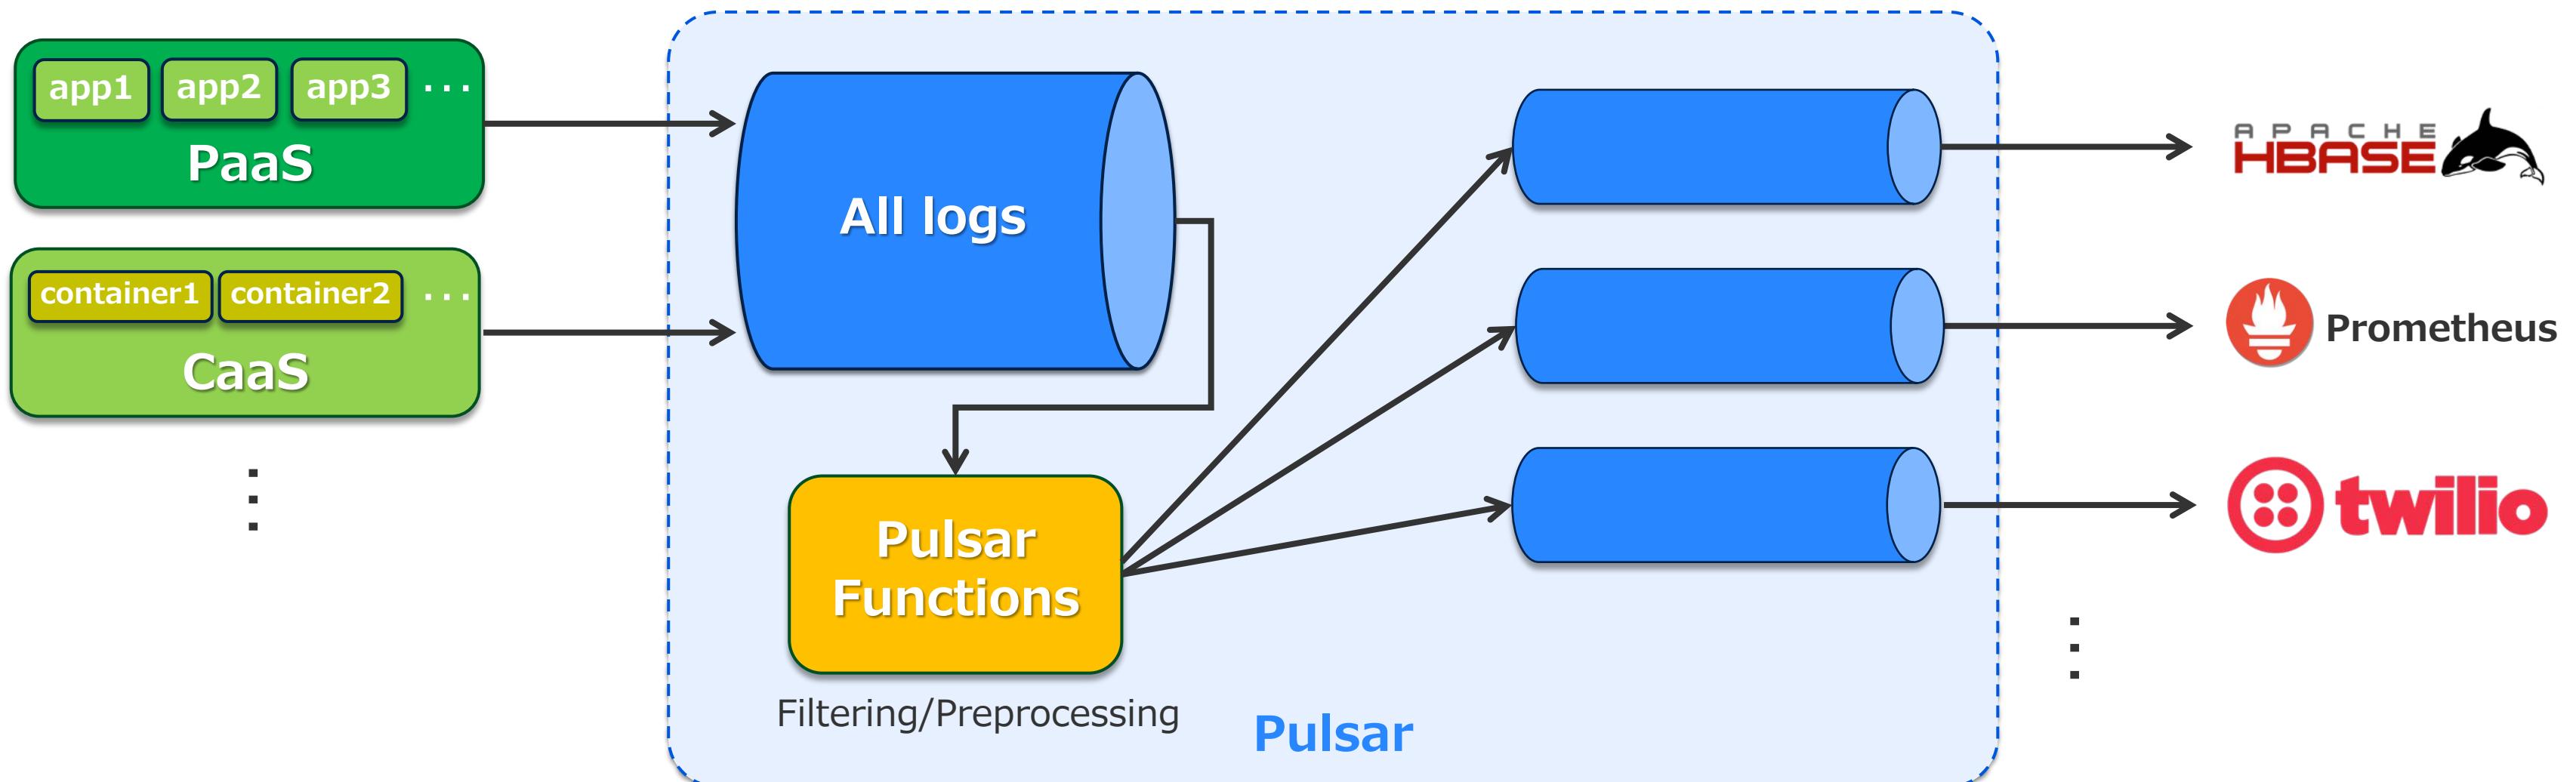

Case 3 – Log collection (under development)

Collect logs from all platforms: PaaS, CaaS, ...

Filtering / preprocessing by Pulsar Functions

Finally send to other DB/platforms: HBase, Prometheus, twilio, ...

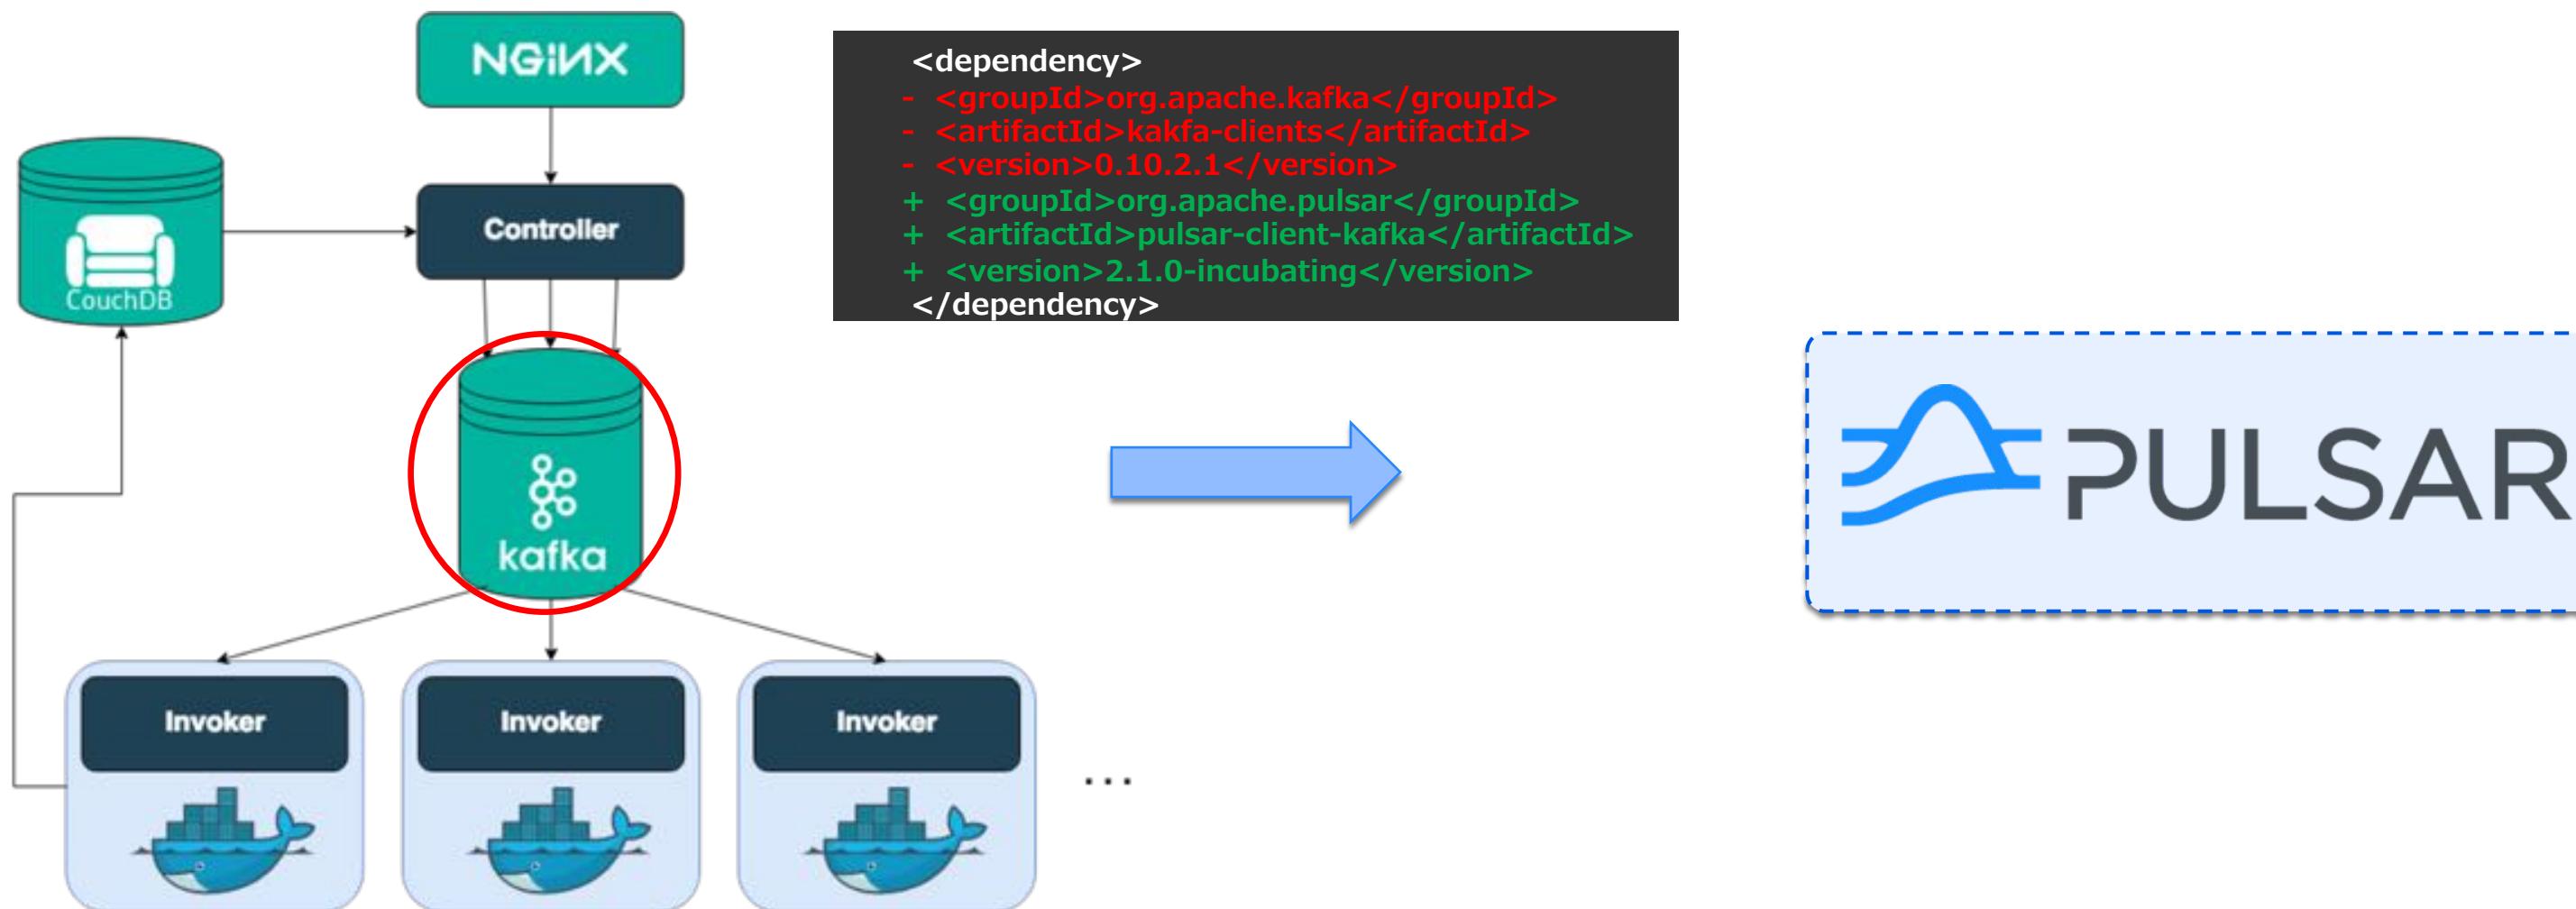

Case 4 – Migration from Kafka

We have an internal FaaS system using **Apache OpenWhisk**

Problem: FaaS team had to maintain **Apache Kafka**

Then they decided to migrate from Kafka to our internal Pulsar

Pulsar Kafka Wrapper needs no code change except configuration for migration

Conclusion

Conclusion

Apache Pulsar

- › Fast, Durable, Scalable pub-sub messaging
- › Has useful built-in features (Geo-replication, Pulsar Functions, etc.)

Feature releases (2.2.0)

- › Pulsar SQL

Documents

- › <https://pulsar.incubator.apache.org/>

Contact

- › <https://apache-pulsar.slack.com/>
- › users@pulsar.incubator.apache.org
