

Community culture, code quality and testability

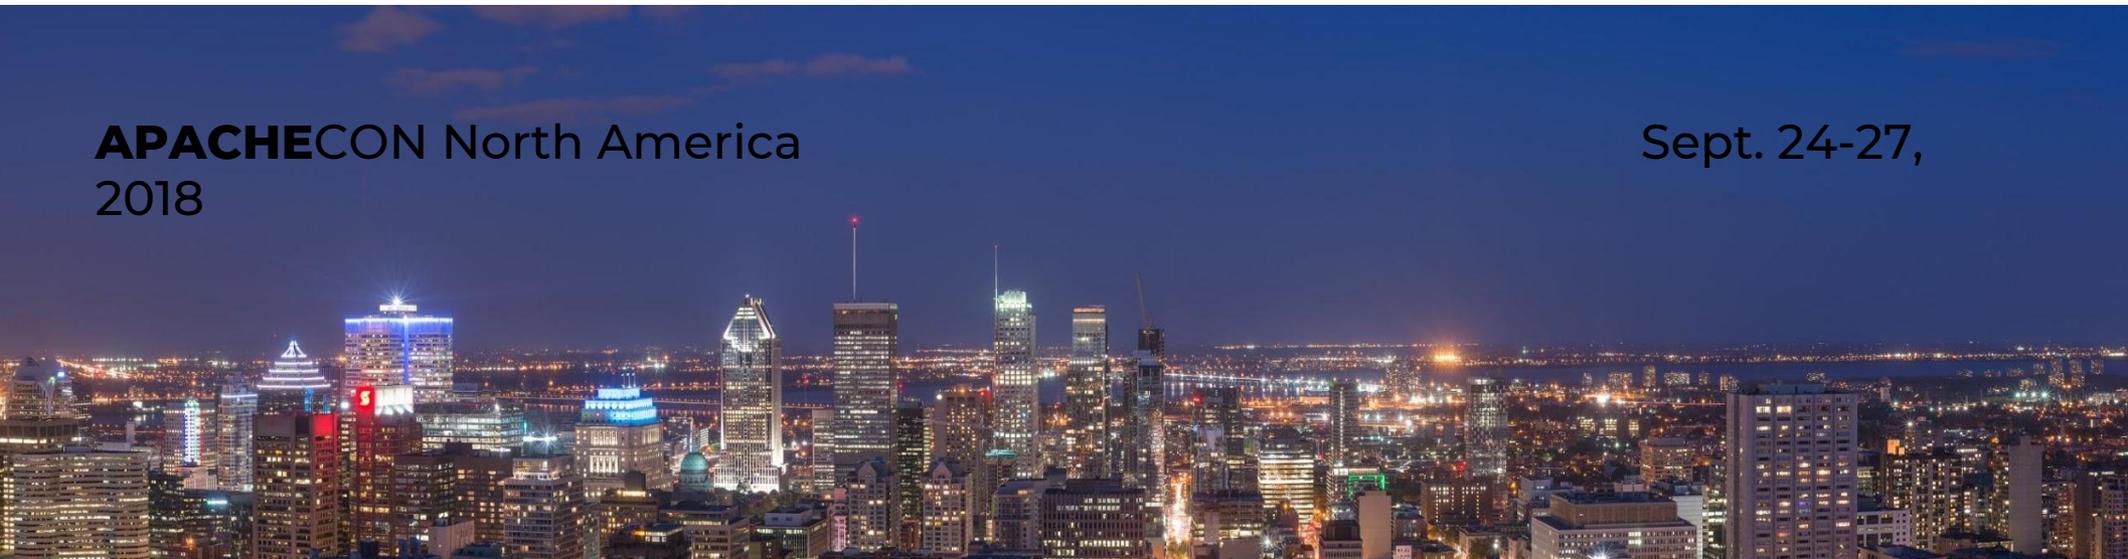

Rafael Weingärtner

Committer/PMC at Apache CloudStack

rafael@apache.org

APACHECON North America
2018

Sept. 24-27,

Who am I ?

- Around CloudStack since 2013
- PMC and committer
- Do not have social networks (none at all!)
- I am not a photographer!
- Sometimes grumpy

What to expect?

- Community, code and culture
- Overview on testing methods
- Tests shaping code
- Code quality and productivity
- Nothing personal!

Communities(groups of people)

- Have something in common (e.g. CloudStack)
- Develop behavior patterns (create a culture)

Code and culture

Human tendency is to stay the same

- *Use of “@Local” annotation*
- *Declare a bean in XML (“<bean>”) and using “@Component”*
- *“Simply” appending the 10th IF conditional to a method*

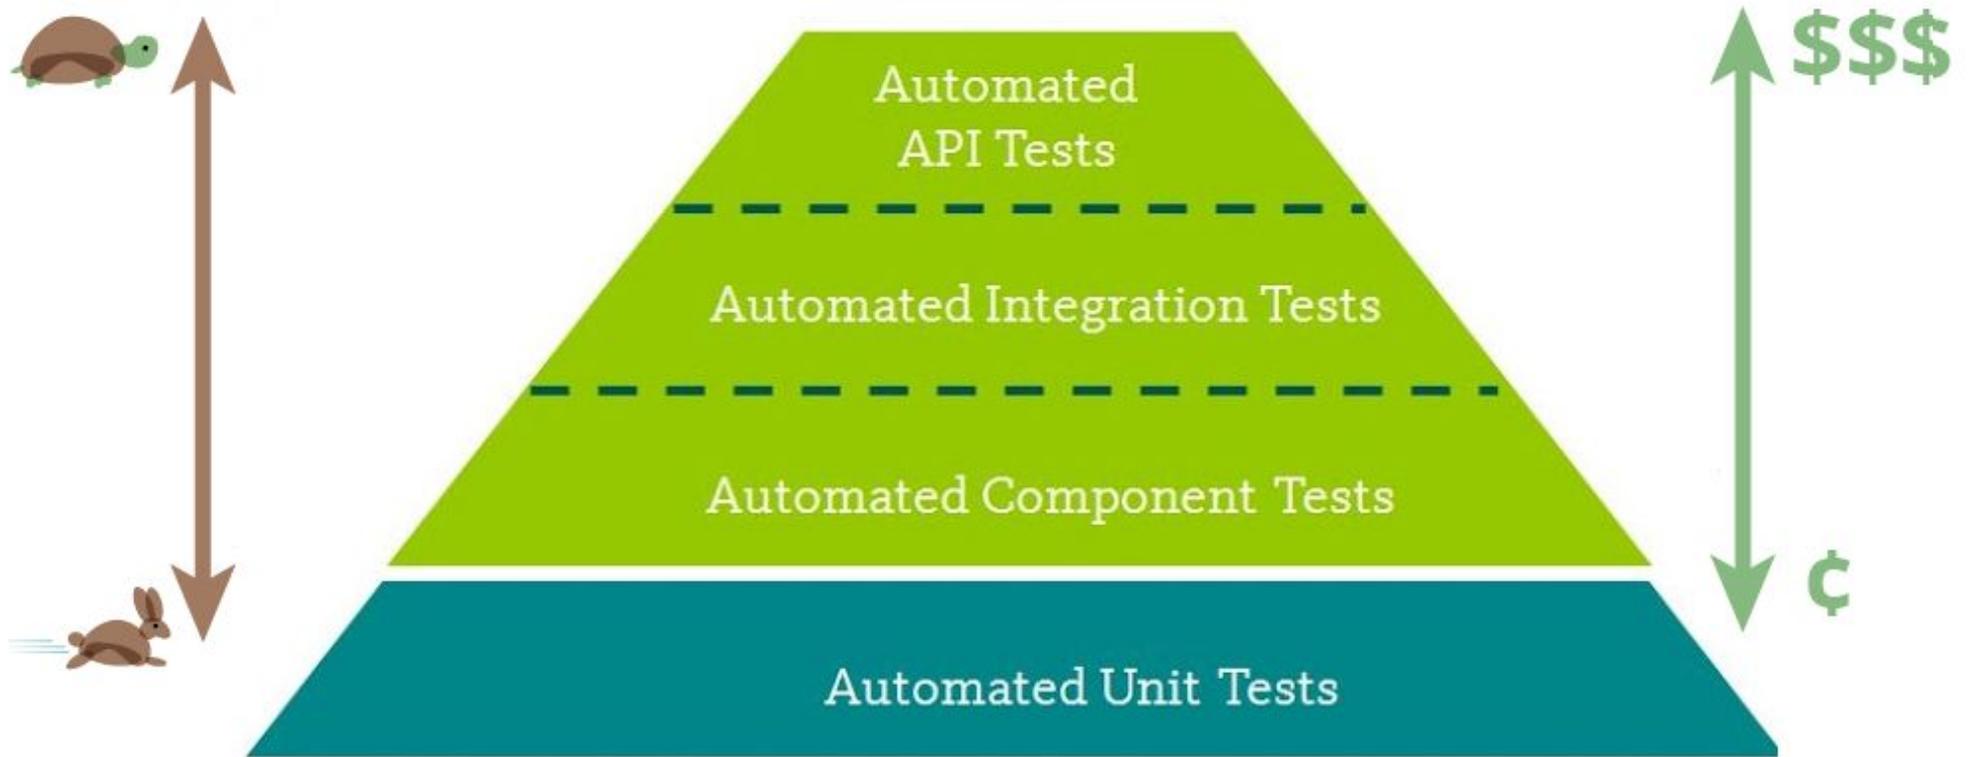

Rules do not matter, what matter is that they are clear

- “...test case is a burden to developers...”
- The 2LGTM trap
- What is the minimum quality bar for a PR?
- Do we want tests?
- Do we want code documentation?

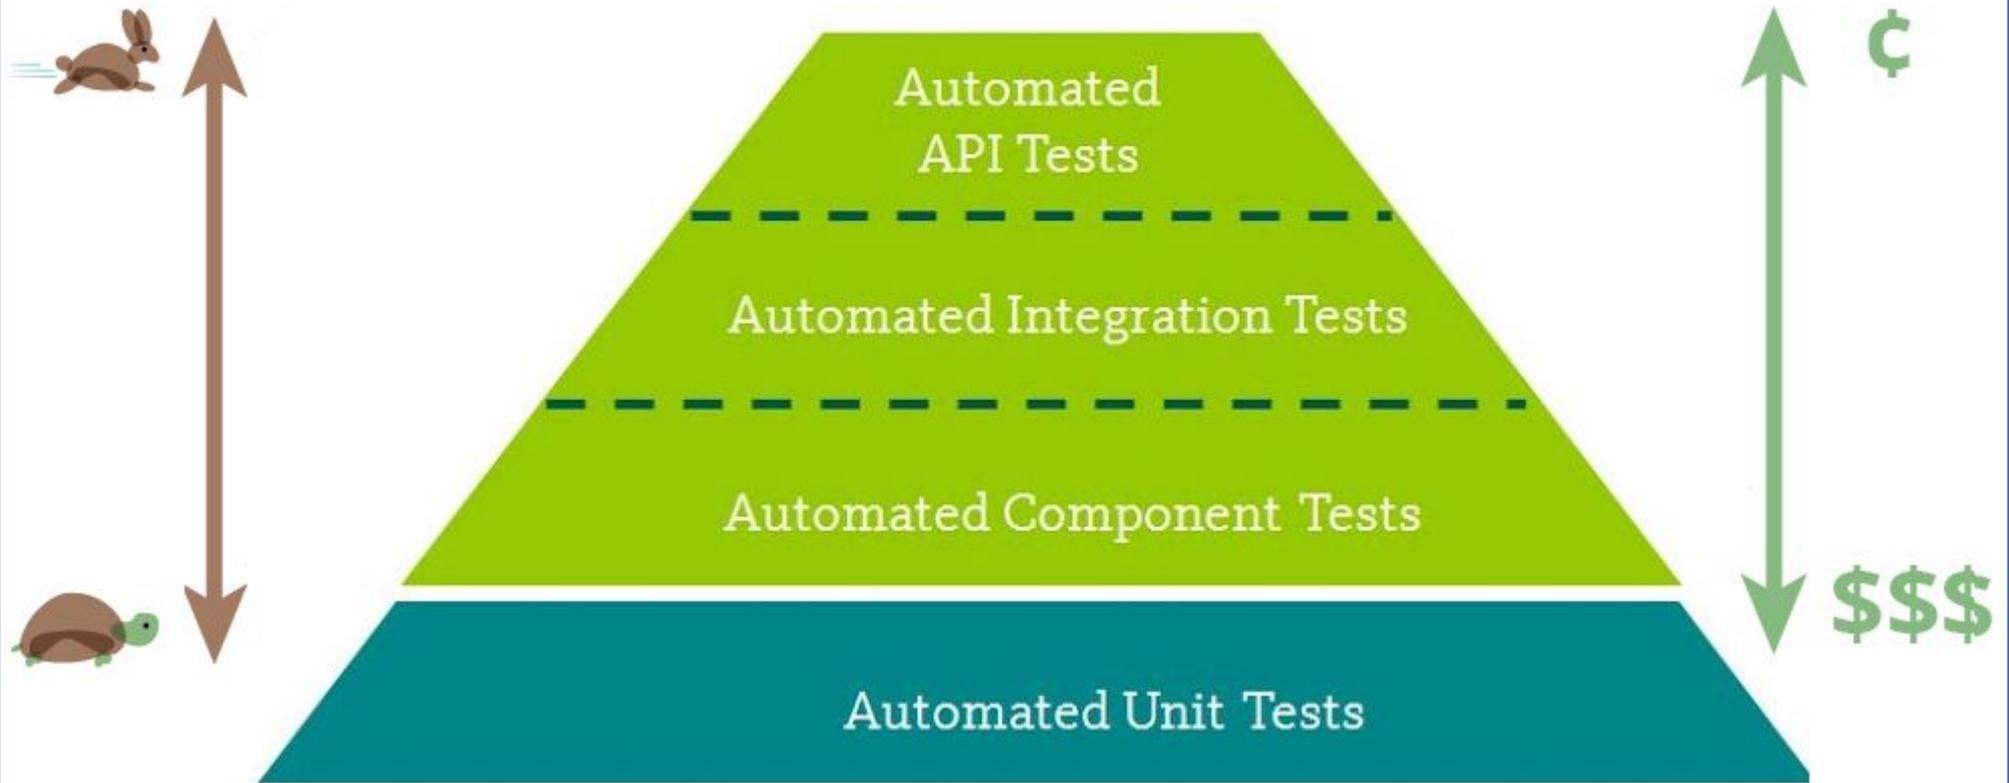

Testing methods (Shallow perspective)

- Functional tests (integration test)
- Unit tests

Test execution pyramid

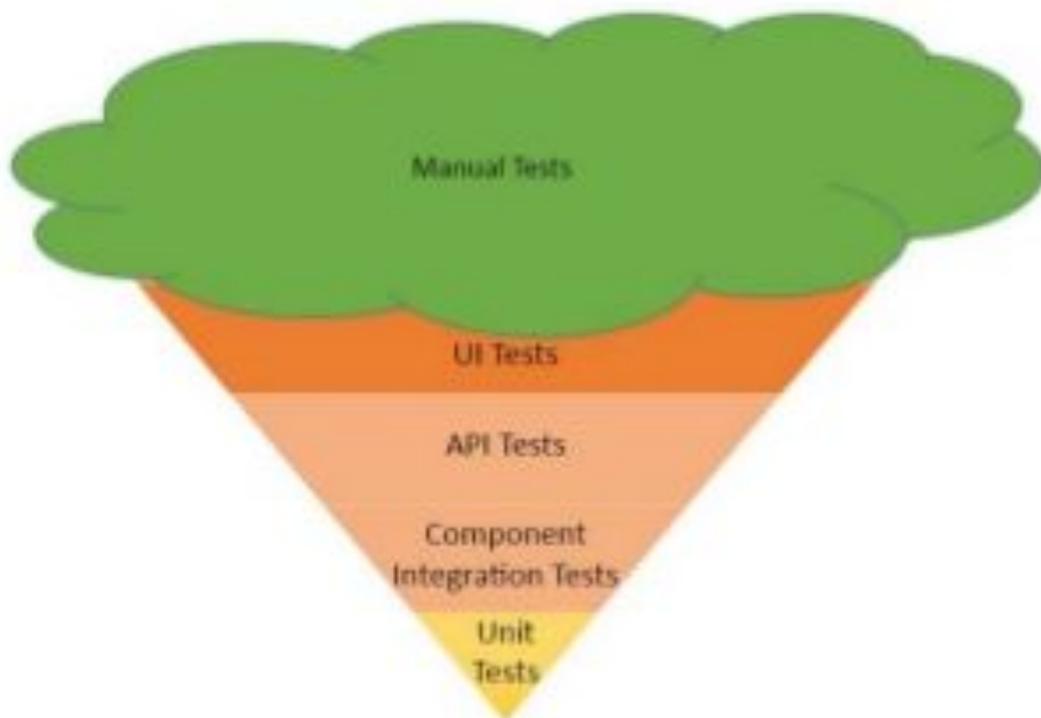

Test development pyramid

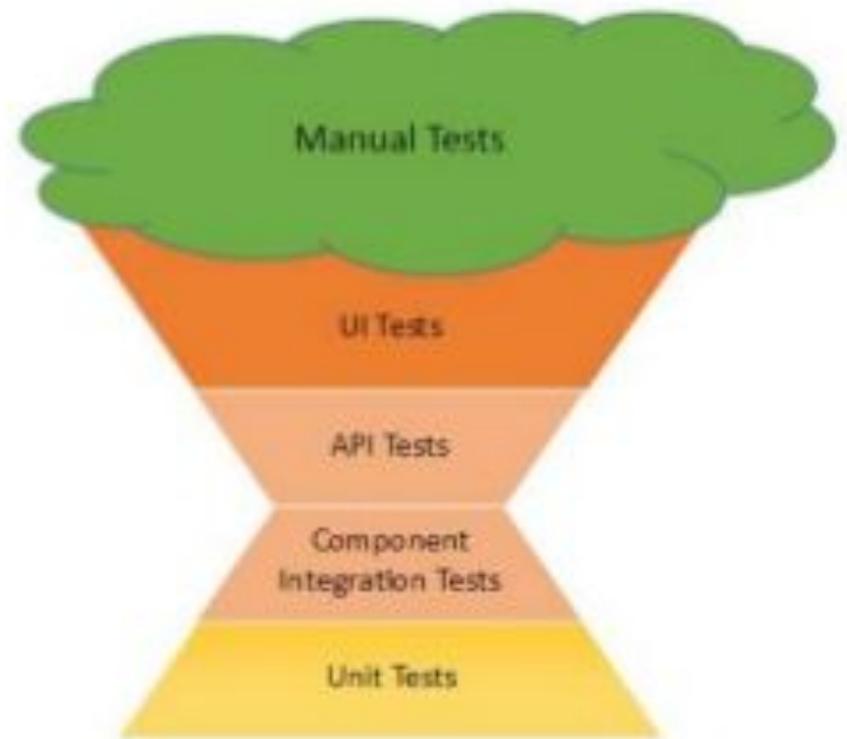

The CloudStack way

Anti-patterns

Ice cream cone

Hour-glass

Why not to unit test? What we hear...

- Requires refactoring (\$\$\$\$)
- Developer time (\$) > computer time (\$)
- Will need to maintain it!

Let's see one example

Why work towards more tests

- Make the project attractive
- Push structural changes in the code
- Facilitate newcomers life
- Enable easier extensions/bug fixes
- Faster pull request cycle
- Use less computing resources for tests

(Test matrix: hypervisors X storage systems X networking systems)

In conclusion...

- Breaks will happen
- We need to talk more about code quality
- Testing can be a quality enabler
- Attract people by quality of code

That's all folks
