ODF@WWW

An ODF Wiki

Kay.Ramme@sun.com

UDK Project Lead / Sun Microsystems

Be **warned**: This talk is about advertising the ODF@WWW ...

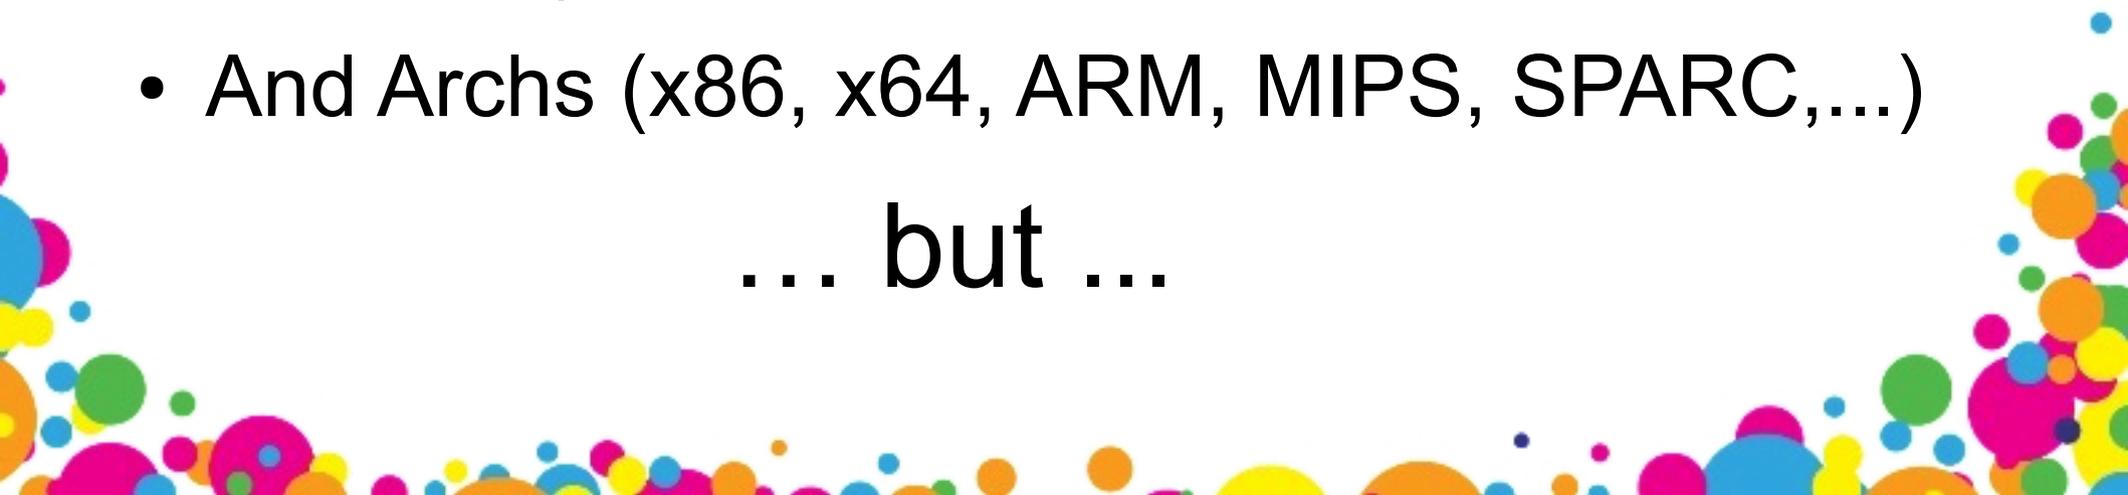

ODF&OOo are a Great Success

...

- ODF is an ISO Standard
- ~3 million downloads a week (OOo 3.0)
- ~150 million deployments
- >100 localizations
- Many platforms (*BSD, Linux, Mac, Solaris, Windows)
- And Archs (x86, x64, ARM, MIPS, SPARC,...)

... but ...

... there is Competition ...

Not only other office suites, but the World Wide Web (WWW), which offers RIAs

- Either Proprietary
 - Adobe Flash
 - Silverlight
 - ...
- Or Free
 - HTML / Ajax

The WWW eases collaboration.

...which is Even Creeping into OOo...

- OOo uses a Wiki for managing projects, documentation ...
- Some People still send documents by mail (including me :-), but ...
- The Collab.Net pages need to be checked via CVS as **HTML** ...

... or Unused Chances :-)

- The WWW is still not (really) editable, at least not WYSIWYG
- (Big) RIAs are not easy to develop
 - Struggle by browser compatibility issues
 - More or less have a poor user experience
 - Just to avoid application installation?
 - But may reach small devices (which is important)
- We already have a Feature Rich Office Suite ...

ODF@WWW

Bringing ODF and OpenOffice.org to the WWW

- ODF and OOo need to enter the WWW
- That means, that we need to use and to leverage ODF and OOo on the HTTP server.
- Completing the client (e.g. OOo)
- This is what ODF@WWW is all about.

The ODF@WWW project aims to develop companion products for ODF and OpenOffice.org to extend their reach into the WWW.

First App.: An ODF Wiki

- Keep it short & simple
- An application is only needed for editing, not for viewing.
- An ODF editor (e.g. OOo) is already available on many / most computers anyway.
- Imagine being able to click an “edit” button ... and OOo opens to change the content :-)

A Short Demonstration

What Others are Saying

- "Wow this is really amazing, finally someone came up with some of my pipe dreams :)"
- "It's an excellent idea, and it is, as you pointed out the tip of the iceberg: what you demoed is the future of OOo."
- "OHMYGOD! M\$ is gonna be so over it!"
- "It's a great start, and I am looking forward to what Ramme develops next with this project."
- "Congratulations for implementing the ODF@WWW feature. It is really amazing."

By now

ODF@WWW

Is an official incubator project :-)

<http://odf-at-www.openoffice.org>

Under the Hood

- Apache2 Web Server
- GNU make
- JODConveter
- Dedicated MIME Types (.rodt, .rods, ...)
- Some Server Side scripts
- A client helper script
- Overall: ~180 lines of code (even with some redundancy ;-)

Outlook

- Compound documents: Managing documents on the server allows to dynamically re-combine documents and their parts (paragraphs, charts, styles, ...)
- OOo “browser” mode for easy navigation
- ODF based Blog Server
- ODF RIA applications: Like HTML / Ajax

I want you for ODF@WWW :-)
Come and help!

Q&A

Thanks!
